## 1.0 Introduction

Lu Engineers was retained by the City of Rochester to conduct a Predevelopment Subsurface Conditions Analysis (PSCA) at the Orchard Whitney Brownfield Site (“Site”) which has been targeted for redevelopment. The Site occupies 3.9-acres located at 415 Orchard Street and 354 Whitney Street in the City of Rochester (Figure 1). The Site is now vacant, but included large scale industrial uses in the past. Structures previously occupying the Site were demolished between 2005 and 2015 due to the unsafe condition of the buildings.

The City of Rochester has invested substantial efforts to facilitate development in this area of the City. The City has been awarded brownfield area-wide grant funding from the United States Environmental Protection Agency (USEPA) to develop an area-wide revitalization program focusing on brownfield sites located in the Jay/Orchard Street area (JOSANA neighborhood). In addition to substantial grant funding from the New York State Department of Environmental Conservation (NYSDEC) to facilitate investigation and cleanup of the Orchard Whitney Site, the property is located within a NYS-designated Brownfield Opportunity Area (BOA), known as the Lyell-Lake-State (LYLAKS) BOA. The JOSANA Master Plan and LYLAKS BOA Revitalization Strategy both emphasize the importance of redevelopment of the Orchard Whitney Site to the revitalization and sustainability of this challenged area of the City. The property is located immediately south of Lyell Avenue in the LYLAKS Brownfield Opportunity Area (BOA).

The Site was historically residential until the early 1900s when it was developed into an industrial facility covering both the 415 Orchard Street and 354 Whitney Street parcels. The Site is a fenced vacant lot covered mainly with concrete slabs and building demolition debris. A large berm of brick, concrete, and debris is located on the southern and western edge of the Site. The Site is bordered by Orchard Street to the east, a former railroad right-of-way to the south, Whitney Street to the west, and commercial buildings to the north. Figure 2 is a Site Plan showing current conditions at the Site.

The development considerations discussed in this report include environmental and geotechnical conditions as well as a preliminary assessment relative to utility access. Each of these considerations is addressed in detail in the sections that follow.

## 2.0 Site Background and History

The area occupied by and surrounding the Site was originally developed with residential housing in the mid to late 1800’s. Railroads extended through the southern adjacent properties circa 1875. The tracks were used for coal as well as materials delivery and shipping as the Site developed into manufacturing and industrial uses in the early 1900s.

From 1915 to 1922, the North East Electric Company occupied the Site. The Delco Appliance Division of General Motors occupied the Site from 1930 to 1967 and had several processes including the manufacture of electrical equipment, various metal finishing operations, coal storage, boiler operation, power generation, petroleum storage and small scale automotive service.

The facility was expanded to its pre-demolition Site size and configuration by 1935. The plant closed in 1967 and the property continued to be used for metal finishing, synthetic foam production, printing, plastics manufacturing, electronics manufacturing and warehousing until 1990 when the Site was abandoned.

Site conditions continued to decline after 1990 and in 2003, a large portion of the structure at the Whitney Street parcel was damaged during an arson fire. The City partially demolished the structure in 2005 to reduce the risk of collapse and to eliminate other hazardous conditions at the Site.

The City foreclosed on the Whitney Street parcel in August 2006. Figure 3 provides an overlay of the Orchard Whitney site comparing existing conditions to historical buildings and operations.

Due to deteriorating and unsafe conditions of the structure at 354 Whitney Street, the City completed asbestos abatement and demolition of the structure in order to safely complete Remedial Investigation (RI) activities. The remaining building structure on the Whitney Street Site was demolished as an interim remedial measure (IRM) during this investigation in April and May 2008. The northern portion of 415 Orchard (“Low Rise”) was demolished in 2010. The final phase of building removal was completed in December 2015 with the demolition of the seven-story “High Rise” formerly occupying the southern portion of the 415 Orchard Street parcel.

IRM activities are summarized in two (2) reports including a combined Site Investigation/Remedial Alternatives Report and Interim Remedial Measures Construction Completion Report, (Lu Engineers, January 2014) as well as an Interim Remedial Measures Construction Completion Report (Lu Engineers, November 2015). Copies of these reports are included as Appendix 1 to the PSCA. Appendix 1 also includes the Site Management Plan (Lu Engineers, October 2015), which identifies remaining areas of potential environmental concern and outlines procedures required for handling and screening of potentially contaminated environmental media.

The primary occurrence of elevated concentrations of regulated chemicals identified during previous investigations and remedial activities was related to metals contaminated soil and groundwater as a result of past metal finishing operations, hydraulic lift, former gasoline storage and pumps, and underground petroleum storage. Semi-volatile organic compounds (SVOCs) and in particular, polycyclic aromatic hydrocarbons (PAHs), have also been detected on the southeastern portion of the Site in the vicinity of former plating operations and underground petroleum storage tanks.

Sample analytical results indicate that compounds detected in soil are below NYSDEC Residential Use Soil Cleanup Objectives (6 New York Codes, Rules, and Regulations (6NYCRR) Part 375-6b). Minor exceedances of 6NYCRR Part 703 Drinking Water Standards remain in some of the groundwater monitoring wells located within the Site. It is noted that the City of Rochester prohibits extraction of groundwater for consumption or use. As defined in the SMP provided in Appendix 1, engineering controls (ECs) and deed restrictions on use (institutional controls, (ICs)) mitigate the possibility of human or environmental contact with potentially contaminated environmental media on the Site.

Several types of record mapping are included with this report for general reference. Appendix 2 includes copies of the NYSDEC Environmental Easement, Metes and Bounds Description(s) and Site Survey Map. Appendix 3 includes Rochester Gas & Electric Company Record Drawings. Copies of Sanborn Fire Insurance Maps are included as Appendix 4. Additional reference maps are included as figures or attached as appendices as noted in the following sections of this report.

### **3.0 Summary of Previous Environmental Reports**

A summary of previous environmental work completed at the Site shows that the following investigation actions have been performed at the Orchard-Whitney Site:

- Draft Center City Industrial Park Facility Assessment, Flint, Allen, White & Radley, April 1999;
- EPA Hazardous Substance Removal Action, 1999
- Phase I Environmental Site Assessment (ESA): 354 Whitney Street and 367, 370, 406, and 415 Orchard Streets, DAY Environmental, Inc. 2000;

- Pre-Demolition Asbestos Inspection of 354 Whitney St Building 1A, ENSR International, 2003;
- Pre-Demolition Asbestos Inspection of 354 Whitney Street Building 2/2A/ Brick Mill, ENSR International, August 2003;
- Pre-Demolition Asbestos Survey 415 Orchard Street High Rise and Low Rise Structures, Lu Engineers, August 2006
- Orchard-Whitney Targeted Site Assessment Report, NYSDEC Region 8, December 2006.
- Hazardous Materials Investigation and IRMs, Lu Engineers, 2006
- Post-demolition Site-wide investigation completed by Lu Engineers, 2008-2009 as outlined in the Remedial Investigation Work Plan (August 2006);
- Pre-demolition Investigation for 354 Whitney Street (February 2007);
- Area of Concern (AOC) investigation and IRMs by Lu Engineers, 2011-2012 as described in the Remedial Investigation and Interim Remedial Measures Work Plan (April 2011);
- Pre-Demolition Investigation for 415 Orchard Street “Low Rise” (January 2012)
- Site Investigation/Remedial Alternatives Report and Interim Remedial Measures Construction Completion Report, (Lu Engineers, January 2014) – See Appendix 1
- Interim Remedial Measures Construction Completion Report (Lu Engineers, November 2015) – See Appendix 1
- Site Management Plan (Lu Engineers, October 2015) – See Appendix 1

### **3.1 Draft Center City Industrial Park Facility Assessment, 1999**

The Flint, Allen, White & Radley Draft Center City Industrial Park Facility Assessment consisted of visual inspection and analysis of general structural and Site conditions including interior and exterior roof conditions, floor loading potential and an estimated cost for rehabilitation and/or demolition. The results indicated rehabilitation costs, not including hazardous materials or asbestos abatement, could exceed \$5.8 million dollars.

### **3.2 USEPA Hazardous Substance Removal Action, 1999**

Numerous drums containing suspected hazardous wastes were found in the abandoned 354 Whitney Street building during an inspection conducted by the City and NYSDEC. NYSDEC requested that the USEPA characterize and remove the abandoned wastes to mitigate the significant environmental and human health hazard posed by these substances. USEPA removed and disposed of over 700 drums of various sizes during this removal action. This building was later gutted by fire in 2003 and subsequently demolished by the City in 2006.

### **3.3 Phase I ESA, 2000**

A Day Environmental, Inc. Phase I ESA completed in 2000 identified several Recognized Environmental Conditions including:

- The presence or former presence of petroleum or chemical underground storage tanks (USTs), the locations and removal of which could not be confirmed. Laboratory analysis of samples from pre-existing monitoring wells at the Site indicated that petroleum, RCRA metals and chlorinated solvent contaminants were present in groundwater above regulatory standard and guidance values.
- Historical uses of the properties and adjacent properties suggested the use, storage and generation of Resource Conservation and Recovery Act (RCRA) hazardous wastes such as: oil and lead based paints, lubricants, flammable liquids, heavy metals, and polychlorinated biphenyl (PCB) oils. In addition, the Site is known to have at least two (2) documented NYSDEC spill incidents;

- The presence of suspected and confirmed asbestos containing materials (ACM) throughout all structures at the Site;
- Visual evidence of additional spills in locations where numerous drums of unknown materials were being staged;
- The presence of several transformers, hydraulic lifts, and other motorized equipment commonly associated with PCB contaminated oils; and
- The presence of floor drains and/or sumps throughout the buildings containing unknown liquids, chemicals and residues. The discharge points of the drains and sumps could not be confirmed.

### **3.4 Asbestos Pre-demolition Surveys, 2003**

The ENSR International, Inc. Pre-Demolition Asbestos surveys of the structures on the Whitney Street parcel conducted in 2003 indicated that friable and non-friable asbestos was present throughout all Site buildings including: roofing and flooring materials, window glazing, pipe insulation, wall board and insulation. Portions of the Site were already in decline, and friable asbestos was present where roofing materials had collapsed, windows were vandalized and pipe and wall insulation was damaged.

### **3.5 NYSDEC Investigation, 2005**

The NYSDEC conducted a Targeted Site Assessment in the summer and fall of 2005 to evaluate the 354 Whitney Street Site for potential registry as an Inactive Hazardous Waste Disposal Site (IHWDS). The assessment consisted of:

- A geophysical survey to determine the location of buried metallic anomalies such as USTs or utilities;
- A utility survey to locate major utility right-of-ways and to identify potential contaminant pathways;
- Installation of soil borings and 6 groundwater monitoring wells to assess subsurface soil and groundwater quality and flow direction;
- Collection of surface soil samples to determine the potential for direct contact exposure to contaminants; and
- Collection of basement standing water samples to determine whether it could be a source of contamination to groundwater.

A copy of the 2005 geophysical survey is included as Appendix 5.

The results of the NYSDEC investigation indicated surface soil samples were contaminated with PAHs and PCBs, as well as metals. However, the investigation was inconclusive as to the source, nature and extent of any subsurface soil or groundwater contamination at the Site. The Site was not listed on the IHWDS registry; however, further investigation was recommended to fully evaluate conditions at the Site.

### **4.0 Lu Engineers Investigations and Interim Remedial Measures**

A variety of RI efforts and IRMs have been completed at various times since Lu Engineers was retained by the City in July 2006. This iterative approach was necessary due to the fact that RI and IRM work needed to be coordinated with the demolition of 354 Whitney Street in 2008 and the “Low-Rise” portion of 415 Orchard Street in 2010 and 2014 demolition of the 415 Orchard “High Rise”. IRMs were required to allow demolition in certain cases and to facilitate access to areas of the Site requiring additional RI work. IRM and RI efforts to date have been summarized as they were completed in memoranda and correspondence provided to the City, NYSDEC and NYSDOH, as necessary.

Site investigation and IRM activities with potential relevance to future planned Site development are summarized in two (2) reports including a combined Site Investigation/Remedial Alternatives Report and Interim Remedial Measures Construction Completion Report, (Lu Engineers, January 2014) as well as an Interim Remedial Measures Construction Completion Report (Lu Engineers, November 2015). Copies of these reports are included as Appendix 1 to the PSCA. Appendix 1 also includes a copy of the Site Management Plan (Lu Engineers, October 2015), which identifies remaining areas of potential environmental concern and outlines procedures required for handling and screening of potentially contaminated environmental media.

The following sections provide detail on the remedial investigation and cleanup efforts completed under the City's State Assistance Contract

#### **4.1 2006 Hazardous Materials Investigation and IRMs**

Lu Engineers conducted a detailed inspection of the structures located on the Site at that time including the 415 Orchard Street "High" and "Low-Rise" as well as the various contiguous structures remaining at 354 Whitney Street. This investigation was conducted in order to locate and characterize the presence of hazardous or otherwise contaminated materials other than asbestos that required removal prior to demolition. Small amounts of abandoned waste paints, oils and boiler chemicals were disposed of at that time. Other materials were characterized for removal during demolition by the demolition contractor.

Three non-PCB-containing transformers located on the outer wall of the 6<sup>th</sup> floor of 415 Orchard Street were also removed and disposed of to prevent them from potentially falling during demolition of the adjacent structure. Vandalism required cleanup of spilled non-PCB oils from the ground surface as part of this process. After demolition of the 354 Whitney structures, a total of 218 tons of arsenic (D004) hazardous waste ash from the boiler house chimney was transported and disposed of off-site in accordance with all applicable regulations.

Masonry demolition debris was crushed to approximately 4-6 inches in diameter and staged on Site above the existing pile of demolition debris left after demolition of the westernmost portions of the 354 Whitney Street complex in 2003. Crushed masonry demolition debris was also staged along the western perimeter of the Site along Whitney Street at that time.

#### **4.2 2008 RI and IRMs**

Once the remaining 354 Whitney structures were demolished, the majority of the Site was accessible facilitating a more comprehensive investigation, which included:

- Installation and sampling of a total of 16 monitoring wells (MW-07 through MW-22)
- Drilling of a total of 6 soil borings (SB-01, 03, 05, 07, 19 and 20 (intervening numbers were completed as wells))
- Excavation of a total of 18 test pits (TP-01 through 18)
- Manual excavation of 4 surface soil samples (SS-01 through 04)

As test pits were installed in the central and southern portion of the Site, elevated screening levels and indications of waste materials were observed in clay tile crocks associated with the former drainage features present on the ground floor of the former buildings. One (1) drum of non-hazardous, solvent contaminated sludge was removed and disposed of off Site as an IRM during this process.

The findings of the 2008 RI indicated the presence of abandoned USTs and elevated subsurface chromium concentrations adjacent to the western wall of 415 Orchard Street.

These locations were designated as Areas of Concern (AOCs) 1 and 2, respectively. An abandoned hydraulic lift was identified (AOC-3) in the north/central portion of the Site. Elevated screening data and petroleum odors were found in the northern portion of the western area of the Site warranting designation as AOC-4.

Surface soils from the immediate vicinity of the Site were found to contain relatively low levels of metals and SVOCs indicative of typical urban background conditions. With the exception of the elevated chromium levels found at AOC-2, subsurface soil and groundwater were not observed to be significantly impacted within the study area.

Data gaps remaining after completion of the 2008 RI included the presence of a large tunnel aligned east/west located in the center of the Site with smaller tunnels branching off to the north and south apparently associated with utilities as discussed elsewhere herein (See Figure 2). The nature and extent of contamination associated with AOCs 1 through 4 and potential presence of contamination not accessible beneath 415 Orchard Street at that time were also considered to be data gaps requiring additional investigation.

#### **4.3 2011 RI and IRMs**

RI and IRM efforts were conducted concurrently during 2011 to minimize the mobilization and demobilization of equipment to and from the Site. IRM work focused on the closure of a total of nine (9) petroleum USTs located within AOC-1. During this process, a total of 14,250 gallons of petroleum and petroleum-contaminated water was removed and disposed of off-Site. A total of 11,500 gallons of petroleum-contaminated water were treated on-Site and discharged under permit to the Monroe County sewer line on the western side of Orchard Street. The remaining 2,750 gallons of water was transported off-Site for proper disposal/recycling.

This process also included the removal and proper disposal of 265 tons of petroleum and metals impacted soils. The concrete vaults surrounding the tanks were backfilled with flowable fill to a depth of approximately 5 feet below grade to prevent infiltration of contaminated groundwater from the adjacent AOC-2 (Former Plating Area). The remainder of the backfill was completed with clean imported fill and crushed demolition debris from the materials staged on Site.

Additional RI efforts at this time included soil borings and test pits to more completely characterize soils beneath the former “Low Rise”, the staged demolition debris berms, and gasoline vapors observed at TP-07. The findings of this additional investigation effort did not warrant further investigation or remedial measures in these areas of the Site.

#### **4.4 2012 RI and IRMs**

The additional RI work conducted in 2012 was limited to re-sampling of all Site groundwater wells once the IRMs were completed with respect to AOC-2 and AOC-3 as well as a more detailed review of the nature and extent of the tunnel systems present on the Site. A subcontracted utility scanning company was brought to the Site to televise accessible portions of the remaining drainage features and tunnels.

The large east/west oriented tunnel was also entered to determine whether hazardous materials were present and to verify that its steel reinforced concrete roof could bear the load trucks and other equipment to be mobilized for remediation of the adjacent AOC-2. Lu Engineers determined that the roof of the tunnel was capable of bearing the weight of all proposed activities above. Inspection of the tunnel also revealed the presence of friable asbestos pipe covering within and approximately 5 feet of standing water (determined

previously to be uncontaminated). The tunnel floor and walls are concrete and it is approximately 12 feet deep. Other branching portions of the tunnel system could not be accessed within the Site and are assumed to be primarily associated with utilities which served manufacturing operations in the past. A portion of a closed tunnel was accessed from a commercial property (Turner Bellows, Inc.) to the west of the Site. However this tunnel terminates at the Site's western perimeter.

IRM effort during 2012 focused on remediation of hazardous levels of chromium (hexavalent chromium) and other RCRA metals identified in soil and groundwater within the former plating area (AOC-2). A total of approximately 500 tons of hazardous and non-hazardous soils contaminated with chromium, arsenic and cadmium were removed from AOC-2 and properly disposed of off-Site. Lu Engineers used a portable x-ray fluorescence (XRF) meter to assist in the differentiation of soil contaminant levels during both the AOC-2 RI and IRM process.

Careful planning around seasonal weather and groundwater variations allowed removal of the affected soils without requiring groundwater removal during this process. Hazardous groundwater was treated in-situ during and after backfilling with clean imported crushed stone and select fill. A total of 300 gallons of a molasses and water mixture was fed by gravity into the subsurface to reduce residual concentrations of  $Cr^{+6}$  to the insoluble  $Cr^{+3}$  state. Molasses encourages the growth of anaerobic bacteria which results in conditions conducive for chemical reduction. Subsequent groundwater sampling indicated that no hazardous conditions remained. Limited occurrences of elevated, but non-hazardous levels of chromium, arsenic and chromium remain after completion of this IRM due to limited access during the excavation process.

AOC-3 was also remediated concurrently with the AOC-2 effort. A small amount (less than 1 ton) of petroleum contaminated soil as well as the hydraulic lift itself were removed and disposed of during the 2012 IRM work.

Groundwater depths at the site range from 4 feet on the west side of the property to 10 feet near the former plating area. Groundwater flow at the site is generally to the northeast. Bedrock depths vary significantly from 8 to 10 feet bgs on the western portion of the site to over 35 feet bgs near the former plating area. Groundwater and bedrock depths and their potential impact on commercial development are discussed in Section 8.0.

Figures 4 through 7 contain plans showing locations of soil and groundwater testing, a groundwater flow interpretation, bedrock contours, and geologic cross sections.

#### **4.5 2014 Asbestos Abatement at the Orchard Street "High Rise" Site**

Asbestos abatement to facilitate building demolition began at the Orchard Street building on June 30, 2014 and was completed on October 25, 2014. Demolition began immediately thereafter and was completed by June 2015.

#### **4.6 2015 RI and IRMs beneath former Orchard Street "High Rise" footprint**

Beginning in June 2015, Lu Engineers conducted an expedited RI beneath the foot print of the former 7-story building at 415 Orchard Street. This work included installation of a total of 16 test pits and four (4) soil borings/monitoring wells.

Prior to completion of the excavation IRM, asbestos containing materials (ACM) located in the underground utility trench required abatement prior to accessing the underlying petroleum-contaminated soils.

Lu Engineers worked with the New York State Department of Labor (NYSDOL) to secure a variance request for relief from certain provisions of Industrial Code Rule 56. As indicated, the variance was required due to the uncertain nature and extent of the utility trench and facilitates safe and fully compliant abatement with certain procedural adjustments. Abatement began on September 21, 2015 and concluded, including inspection and air sampling activities, by October 2, 2015. A Project Monitoring for Environmental Abatement Report was submitted to the City under separate cover in November 2015.

Soils in the delineated removal area were continuously field screened by PID so that the soils which exceeded 25 ppm were live-loaded into Part 360 permitted trucks for off-Site disposal at High Acres Landfill. Total estimated removal quantity post completion of the Supplemental Site Investigation was calculated to be approximately 1,500 cubic yards (1,823 tons). Due to the large amount of non-impacted concrete encountered, the actual combined total volume of petroleum-impacted soil removed for off-Site disposal was approximately 690 tons (568 cubic yards).

Soil was removed up to the easternmost perimeter and, to the extent possible, beneath the layer of flowable fill which had been placed in the adjacent former tank pit during the 2013 IRMs. Petroleum impacted materials adhering to subsurface concrete structures were scoured to the extent possible by excavator bucket. This method removed the majority of residual contamination on or beneath the subsurface concrete. PID readings generally ranged from 34.1 to 189 ppm throughout the contaminated zone prior to contaminated soil removal.

Based on observations during the IRM excavation, contaminant migration was strongly influenced by the presence of large impermeable concrete foundation components. The distribution of heavily contaminated soils was commonly associated with the soils in contact with subsurface concrete within the vadose zone.

More complete descriptions of 2014 and 2015 RI and IRM activities is provided in the reports included here as Appendix 1.

## **5.0 Geophysical Survey Results and Infrared Imaging**

A geophysical survey (Appendix 5) was completed by GeoMatrix on the 354 Whitney Street parcel in August of 2005. The purpose of the survey was to determine the location of large underground conduits that may act as preferential pathways for environmental contaminant mobility. The survey was completed using frequency domain (EM31) and time domain (EM61) electromagnetic techniques. Both technologies are capable of identifying potential buried metallic objects such as tanks and containers as well as utility piping.

In 2011, Lu Engineers utilized an infrared imaging camera to supplement findings of the Geophysical Survey. Infrared imaging showed the location of the utility tunnels, but the images lack clarity.

A remote mobile camera supplied by Jamko, Inc. was also used in 2011 to evaluate materials and utilities inside the tunnels at that time. The results of the survey were inconclusive with significant interference from reinforced concrete (rebar) and other common anomalies at industrial sites. Jamko's remote camera work showed the presence of utility lines and construction materials in the tunnels and eventually the camera was unable to advance due to blockage.

## **6.0 Test Pit Investigations**

Lu Engineers completed a total of 60 test pit excavations as part of the remedial investigations and cleanup at the Site (2008 to present). Test pit locations were selected based on previous environmental reports, historical maps and suspected areas of environmental concern.

Test pit logs each include soil characteristics, headspace concentrations, water table depth, bedrock depths and other relevant information. Test pit locations are indicated on Figures 6 and 11. Appendix 6 contains logs of test pits completed for the various investigations and remedial activities conducted since Lu Engineers' RI work began in 2008. This appendix also includes an abbreviated reference table including the basic findings from each test pit.

## **7.0 Soil Borings and Monitoring Wells**

Lu Engineers' initial RI effort on the Site was completed in 2008. During this investigation, 21 soil borings were completed. Of these borings, 15 were converted to permanent groundwater wells (conventional hollow stem augering methods). MW designates monitoring wells. 24 soil borings were advanced during the 2011 investigation; 18 soil borings (in the former plating area) were converted to micro wells (Geoprobe® borings). PA-01 thru PA-16 are micro wells and PA-17 and 18 are Geoprobe® borings. Four (4) soil borings were converted into monitoring wells during the 2015 RI Supplemental Site Investigation designated as MW-26 through MW-29. Soil borings which were not converted to wells are designated as SB points. Soil boring and/or monitoring well locations are shown on Figure 6 and 11.

Where hollow stem auger techniques were used, continuous split spoon soil samples were collected in accordance with ASTM Method D-1586 at each boring and characterized using the Burmister Soil Classification System. Where bedrock penetration was required, coring techniques were used to verify the competence of Site bedrock and characterize the hydraulic environment and likelihood of contaminant mobility within the rock. Rock characteristics are logged where sampling was conducted.

Soil boring data was used to create the geologic cross-sections depicted in Figures 7.1 and 7.2.

Boring logs each recorded soil characteristics, headspace concentrations, water table depth, sample recovery, blow counts and other pertinent information. All boring logs were recorded by a qualified geologist. Boring and monitoring well locations indicated on Figures 6 and 11. Appendix 7 contains logs of all wells and borings completed for the various investigations and remedial activities conducted since RI work began, including logs from the NYSDEC's 2005 Site Investigation. This appendix also includes an abbreviated reference table including the basic findings from each soil boring and well.

## **8.0 Fill Management**

Test pits, soil borings and monitoring wells completed during the remedial investigation generally show the presence of fill ranging from 0 to 3 feet in most locations. These depths are considerably deeper in the area surrounding the former basement (8 feet at TP-34) and as much as 13 feet near the former smoke stack location (PA-06).

There is also a large area of fill/construction debris located along the southwest corner and western perimeter of the property. This debris originated from debris from the large fire at 354 Whitney Street and its subsequent demolition. The debris is a mixture of concrete, brick and other building materials. Asbestos containing materials such as transite and thermal systems insulation (air cell) have been observed in the debris. It is estimated that there are 395,000 cubic feet (estimated 22,000 tons) of this material on-site.

The material derived from demolition of the 415 Orchard Street "High Rise" in 2014 was initially staged in piles in the center of the Site. The City and NYSDEC agreed that this material was uncontaminated and suitable as backfill within the Site. Upon completion of the 2015 IRMs, this material was used as backfill in the western portion of the former building (415 Orchard "High Rise") footprint.

The clean, crushed demolition debris derived from the demolition of the former 415 Orchard Street building, was also used as on-Site cover material as part of the final grading of the Site to its current layout – see Figures 2 and 11. This cover will allow classification of the Site as meeting commercial re-use requirements set forth in 6 NYCRR Part 375.

During the regrading process, various openings in the slabs were filled to the extent possible in order to mitigate the potential hazards associated with those openings. The entrance to the east/west tunnel was not filled. Instead, a steel plate was bolted down onto the opening to allow future access. This cover and the area surrounding it were covered with approximately two (2) feet of clean crushed demolition debris as indicated on Figure 2.

Significant filling with clean crushed demolition debris was also done at the base of the masonry wall that remains on the southern perimeter off the former 415 Orchard building. This fill was placed in order to mitigate the potential fall hazard posed by this abrupt transition in elevation, and to help support the wall. This fill is also indicated on Figure 2.

## **9.0 Contamination Remaining at the Site**

Based on the investigations and remedial activities conducted on the Site through 2015, a SMP was developed as required as part of the NYSDEC's Record of Decision and Final Remedy Selection process under the ERP. A copy of the SMP is included as Appendix 1. The Site is currently being considered and the City is accepting proposals for commercial or light industrial development Site planning. As a result of the existing conditions, recommendations for future Site work include an updated Environmental Easement and a SMP as part of the Site remedy. The SMP provides various means of identifying areas of the Site with residual contamination that may require special handling and/or disposal. The SMP also specifies procedures to be followed if contaminated media is encountered during future Site use or redevelopment. Refer to Figure 4 for a representation of remaining soil and groundwater contamination at the Site.

Access to the most heavily contaminated soils identified during the SSI and IRM process was not substantially restricted by the presence of massive concrete foundation components. The foundations appeared to rest directly on bedrock indicating that the overburden/bedrock interface migration pathway does not exist in these locations. Small areas of low-level contaminated soils not accessible due to excavation collapse or other factors during IRM implementation are considered likely to biodegrade over time. The source area(s) for petroleum contamination at this Site have been removed to the extent possible. Based on confirmatory soil sample data, however, the excavation of the source area has been successful in removing accessible petroleum-impacted soils.

Previous investigations have shown that elemental lead exists in the concrete slab on-Site. Lead was commonly used to seal cracks and penetrations in floor slabs in industrial plants in the past. Small nodes of lead have been observed in the remaining slabs at the Site in a number of locations. Prior attempts to quantify the amount of lead remaining in the slabs have been complicated by the presence of varying amounts of dust and debris at the surface. Since large portions of the slab will remain, elemental lead will remain on-Site and as a result will be addressed in the SMP, as necessary.

Remaining asbestos pipe wrap in the existing underground tunnel system presents an existing condition and potential for exposure during future subsurface disturbances or activities. The presence of asbestos in the subsurface is addressed in the SMP.

Overall groundwater flow appears to follow a general east, northeast flow direction. It is noted that MW-27 was omitted from the data used for groundwater contour map development due to it anomalously low elevation representative of deeper flow conditions than observed within the SI/IRM areas. This estimation is based, in part, on the deeper screen interval used in construction of this well and previous observations of subsurface conditions in the immediate vicinity of MW-27. Bedrock depth at MW-27 is substantially deeper at the south end of the former petroleum storage/plating area(s). No environmental impacts have been identified in deeper soil or groundwater in this area of the Site in previous or the current 2015 investigation effort.

Demolition debris (crushed brick and stone) has been re-used as on-Site backfill cover material throughout the Site as an engineering control. Areas of exposed soils have been covered with a minimum of one (1) foot of crushed demolition rubble material. One area of exposed tunnel void space has been covered with a steel plate bolted to the concrete pad in order to prevent exposure to human health and environment. The Site cover system will be inspected annually as a requirement to the SMP.

The Site remedy requires that an environmental easement (through deed restrictions) be placed on the property to (1) implement, maintain and monitor any Engineering Controls; (2) prevent future exposure to remaining contamination by controlling disturbances of the subsurface contamination; and, (3) limit the use and development of the Site to Commercial and Industrial uses only. Adherence to these Institutional Controls (ICs) on the Site will be required by the Declaration of Covenants and Restrictions (DCR) and will implement under the Site Management Plan (SMP).

An environmental easement describing these controls is included in Appendix 2 along with property metes and bounds descriptions and an updated (2015) Site survey map.

## 10. Existing Utility Summary

The site is currently serviced by numerous utilities, the majority of which are under paved roadways, including Whitney Street, Orchard Street, and Lyell Avenue (Figures 8, 9, 10, 12.1 and 12.2 with additional drawings included). The known utilities include:

- Monroe County Pure Water systems – storm and sanitary
- Rochester Gas & Electric – Gas & Electric
- Frontier Communications – Communications
- City of Rochester systems – Water & Street Lighting
- Time Warner Cable- Communications

As the site was formerly occupied by a large industrial facility it was serviced by major utilities at capacities that would be expected to be much larger than a new commercial development at the site. RG&E and Monroe County Pure waters have provided mapping of their systems and general capacity information but have both informed us that any new development should work with them to determine loads in the area. This would also determine if any upgrades are necessary to support the proposed development. If additional utility capacity and infrastructure are necessary, based on specific demands of the propose development, each utility will provide cost estimates for upgrades. If the capacity of the existing utility is adequate, then arrangements should be made with each utility company to connect to existing services.

### 10.1 Monroe County Pure Waters

The Orchard/Whitney site is bordered on the west by Whitney Street, on the north by local businesses then Lyell Avenue, on the east by Orchard Street and on the south by the railroad. The sewers serving this area are

combined sewers. This means they convey both sanitary flows and storm flows. The sewer on Whitney Street is a 1'-6" by 1'-6" stone sewer. This sewer starts at the railroad and flows north to Lyell Avenue where it connects to a 30" RCP sewer flowing east on Lyell Ave.

The 30" sewer continues along the north boundary of the site to the intersection of Lyell Ave. and Orchard Street. At the intersection the sewer increases to a 36" RCP which continues to the east on Lyell Avenue.

On the west side of the site, there is a 2' X 2' stone sewer which flows south from near the Orchard Street-Lyell Avenue intersection and continues south under the railroad tracks all the way to Lime Street. At Lime Street the stone sewer connects with a 42" circular sewer running east on Lime Street.

MCPW has informed us that they have not had ongoing sewer issues in the area or downstream. Whether or not the sewers can support a commercial development will depend on specific development loads. MCPW requires submittal of a PW-2 form indicating average and peak discharge rates from the site. They will also need to look at the storm runoff via the Rational Method where we compare existing and proposed conditions. Depending on the proposed development there may be a need to retain storm water on site.

MCPW provided Mile Square drawings of the area surrounding the Site. The drawings show the size, material and the footage of the sewers. The invert elevations of the manholes are also given, but there are no rim elevations to help indicate depth of sewer. The Mile Square Rock drawings also provide some known rock elevations in the areas of interest. There have been some sewer replacements on certain sections of the map. These changes are shown in the upper corner of the drawings with a box indicating where sewer replacements were done on some streets.

If development results in additional storm or sanitary discharge a Rochester Pure Waters District Permit must be obtained from Monroe County Pure Waters for new connections to sewers. The depth and size of new/relocated storm or sanitary utilities is expected to be similar to the existing utilities. MCPW connections and lines are shown on Figures 12.1 and 12.2.

## **10.2 RG&E**

RG&E has provided general information showing 4 and 11 kv electric circuits in the area. They stated that they could provide more specific information regarding capacity for any new development upon submission of load estimates.

RG&E also provided information on gas capacities in the area. These are shown on TIF drawings included in Appendix 3.

For both gas and electric, it is anticipated that the systems utilized by the former industrial complex are in place and available. Load capacities in the area have remained fairly constant since that time with no known significant demands added in the area.

## **10.3 Frontier Communications**

Service for Frontier Communications is shown on Figure 9. Frontier has full service capability in the area of the Site.

## **10.4 City of Rochester Water Bureau and Street Lighting**

Any water service connections must be approved by the City of Rochester Water Bureau. The depth and size of new/relocated water utilities is expected to be similar to the existing utilities. Water service capabilities

including water for fire suppression (Holley Systems) are shown on Figure 8 with services and connections running along Whitney Street, Lyell Avenue, and Orchard Street. Service for Street Lighting is also shown on Figure 8.

### **11.0 Site Survey**

A survey of the Site was updated by Lu Engineers' NYS Licensed Surveyor in October 2015 to identify excavation limit boundaries and encountered subsurface Site features, such as concrete walls, sheet piling, and concrete subfloor slabs. An ALTA base map of the Site was produced using the NAD 83 UTM Zone 18 (NYTM) coordinate system. An updated metes and bounds description for the Site is also included in Appendix 2.

Monitoring well locations were surveyed and the top of casing determined to 0.010 foot accuracy to mean sea level by Lu Engineers' survey department. Groundwater depths, laboratory analytical data, Site survey data and GPS data was used to prepare groundwater flow models, depth to groundwater and local hydraulic gradient diagrams as well as to prepare contaminant concentration plume maps.

### **12.0 Geotechnical Studies**

A Pre-Development Geotechnical Assessment for the Orchard-Whitney site was completed by Foundation Design, P.C. in November, 2011. This document is included as Appendix 8. Barton and Loguidice, D.P.C. completed a Geotechnical Testing Summary Report in October 2016. This report is included as Appendix 9.

#### **12.1 Foundation Design**

Foundation Design also incorporates seismic considerations into their report and their recommendations can be viewed in Appendix 8.

### **13.0 Conclusions and Recommendations**

Lu Engineers was retained by the City of Rochester to conduct a Predevelopment Investigation at the Orchard Whitney Brownfield Site which has been targeted for redevelopment. Details of any proposed development are currently not available. The development considerations discussed in this report are 1) Environmental; 2) Geotechnical; and 3) Utility Service access. Each of these considerations is discussed below.

#### **13.1 Environmental Considerations**

A general discussion of the Site's history and associated environmental investigation and cleanup efforts is provided in Section 4 of this report. IRM activities are summarized in two (2) reports including a combined Site Investigation/Remedial Alternatives Report and Interim Remedial Measures Construction Completion Report, (Lu Engineers, January 2014) as well as an Interim Remedial Measures Construction Completion Report (Lu Engineers, November 2015). Electronic copies of these reports are included as Appendix 1. Appendix 1 also includes an electronic copy of the Site Management Plan (Lu Engineers, October 2015), which identifies remaining areas of potential environmental concern and outlines procedures required for handling and screening of potentially contaminated environmental media.

Findings from environmental work completed to date show that groundwater at the Site contains several compounds at concentrations exceeding NYSDEC groundwater standards (6NYCRR Part 703). Most of these compounds are located within the former plating area with trace levels of several compounds (chloroform and lead) found in MW-21 and MW-11 respectively. Low levels of chlorinated solvents are also present in other areas of the Site at low levels generally not exceeding NYSDEC standards.

With the exception of the former plating area and two isolated areas along the southern property boundary, surface soil results do not exceed NYSDEC standards for commercial use. This is also true for subsurface soils with the plating area being the only sampled location showing levels of several metals above NYSDEC commercial use standards.

Remedial activities completed to date have mitigated the known environmental concerns relative to the Site and prepared the Site for commercial development. It is not anticipated that the NYSDEC will request further investigation or remediation at the site. As described in the SMP, continued groundwater monitoring will be required. ICs and ECs have been put in place to restrict future use of the property as defined in Appendix 2. It is assumed that vapor mitigation will be necessary as part of the design of future structures on the property.

With such a large amount of asbestos containing debris, disposal of this material is extremely cost prohibitive. It is recommended that the pile be reshaped to facilitate a more appealing landscape berm and covered with a suitable cap. This would need to be done as an asbestos abatement project under a design variance. The NYSDEC-approved ECs and ICs specified in the SMP would require modification if this material is covered or disturbed during future development.

The current environmental conditions at the Site are typical of older industrial facilities located within urban locations. Based on previous investigations and cleanup efforts completed to date, there are not expected to be significant environmental issues inhibiting commercial development. Proposed development options should be evaluated as they are produced to determine if the presence of fill materials or remaining residual chemical compounds may impact construction or future occupancy. Prospective developers are strongly advised to review the 2016 SMP and associated environmental documentation as compliance with this plan is required by law.

## **13.2 Geotechnical Considerations**

### **13.2.1 Foundation Design Report and Letter, 2011**

Lu Engineers provided all available geotechnical information for the Site generated through 2011 to Foundation Design for review. Foundation Design also accompanied Lu Engineers' field crews for a portion of the RI work completed in 2011. The attached (Appendix 8) Geotechnical Assessment Report provided by Foundation Design, P.C. concludes that the upper firm and wet natural site soils can support modest structural loads. The deeper dense glacial till soil can support significant loads from multi-story structures. Bedrock depths vary from 10 to 40 feet below existing grade and should facilitate typical near-surface construction.

Due to the mixed use of the Site over time, there are a number of areas that include various types of fill material. The areas of fill that would present challenges for future construction are primarily located within the former residential use areas of the Site. Refer to Foundation Design's Pre-development Geotechnical Assessment report (Appendix 8) and the Historical Usage Schematic Plan provided in that report for a representation of former residential use areas of the Site. Material used to fill basements of the demolished homes to allow for past industrial development of the Site is likely not suitable for future construction. The Geotechnical Assessment Report recommends that the fill material be removed within any proposed building footprint.

Foundation Design provides detailed recommendations relative to future Site preparation, foundation systems, seismic considerations and pavements. A generalized breakdown of cost considerations and a preliminary cost estimate is also provided in Foundation Design's Opinion of Probable Earthwork Costs date December 2011, which is included with the Geotechnical Assessment report provided as Appendix 8.

### **13.2.2 Barton & Loguidice Report, 2016**

Working under contract with Vita Nuova LLC, Barton and Loguidice completed a Geotechnical Testing Summary Report in November 2016 based on existing information provided by the City and limited field investigation and inspections. A copy of this report is included as Appendix 9. This report provides an analysis of known constraints to development and includes a limited geophysical investigation, inspection of concrete cores, and a limited subsurface investigation. The primary purpose of the subsurface investigation effort was to obtain additional information relative to the tunnel systems underlying the Site. The report makes recommendations for future foundation and cover systems as well as areas of the property where development should be avoided.

### **13.3 Utility Service Access**

The site is currently serviced by numerous utilities, the majority of which are under paved roadways, including Whitney Street, Orchard Street, and Lyell Avenue (Figures 8-10, 12.1, and 12.2 with additional drawings included). The known utilities include:

- Monroe County Pure Water systems – storm and sanitary
- City of Rochester systems – Water & Street Lighting
- Rochester Gas & Electric – Gas & Electric
- Frontier Communications – Communications
- Time Warner Cable- Communications

In addition to utility-specific permits, additional connection or installation permits may also be required. These may include a Street Operating Permit and or Excavation Permit, which can be obtained through the City's Department of Environmental Services Permits Office, City Hall, 30 Church Street.

Based on fill materials and native soils present at the Site, it is likely that these may be considered corrosive to ductile iron pipe. Polyethylene encasement is recommended for ductile iron pipe installation. In shallow fill, trench improvement may be accomplished by undercutting utility trenches to remove fill and backfilling with sub-base/stone for support. Wrapping the pipe and stone in a geogrid is recommended to span small irregularities that may form under the pipe in areas of deeper fill.

The City of Rochester New York Developers Guide should be consulted for guidance regarding required permits and is included in Appendix 10 of this report.

*I, Gregory L. Andrus, CHMM, certify that I am currently a Qualified Environmental Professional as defined in 6 NYCRR Part 375 and that this report was prepared in accordance with all applicable statutes and regulations and in substantial conformance with the DER Technical Guidance for Site Investigation and Remediation (DER-10) and that all activities were performed in full accordance with the DER-approved work plan and any DER-approved modifications.*

---

January 2014

## CERTIFICATIONS

I, Robert Hutteman, am currently a registered professional engineer licensed by the State of New York, I had primary direct responsibility for implementation of the remedial program activities, and I certify that the Supplemental Site Investigation Work Plan and the prior Remedial Investigation and Interim Remedial Measures Work Plan were implemented and that all construction activities were completed in substantial conformance with the Department-approved work plans.

I certify that the data submitted to the Department with this Site Investigation/Remedial Alternatives Report and Interim Remedial Measures Construction Completion Report demonstrates that the remediation requirements set forth in the Supplemental Site Investigation Work Plan and prior Remedial Investigation and Interim Remedial Measures Work Plan and in all applicable statutes and regulations have been or will be achieved in accordance with the time frames, if any, established in for the remedy.

I certify that all use restrictions, Institutional Controls, Engineering Controls, and/or any operation and maintenance requirements applicable to the Site are contained in an environmental easement created and recorded pursuant ECL 71-3605 and that all affected local governments, as defined in ECL 71-3603, have been notified that such easement has been recorded.

I certify that a Site Management Plan has been submitted for the continual and proper operation, maintenance, and monitoring of all Engineering Controls employed at the Site, including the proper maintenance of all remaining monitoring wells, and that such plan has been approved by Department.

I certify that all documents generated in support of this report have been submitted in accordance with the DER's electronic submission protocols and have been accepted by the Department.

I certify that all data generated in support of this report have been submitted in accordance with the Department's electronic data deliverable and have been accepted by the Department.

I certify that all information and statements in this certification form are true. I understand that a false statement made herein is punishable as a Class "A" misdemeanor, pursuant to Section 210.45 of the Penal Law. I, Robert Hutteman, of Lu Engineers, am certifying as Owner's Designated Site Representative for the site.

## Executive Summary

Lu Engineers has prepared this Site Investigation/Remedial Alternative Report (SI/RAR), on behalf of the City of Rochester, to present findings of the Site investigation (SI) and interim remedial measures (IRMs) at the Orchard Whitney Brownfield Site. The Site is New York State Department of Environmental Conservation (NYSDEC) Site #E828123 (the "Site") and is located at 415 Orchard Street and 354 Whitney Street in the City of Rochester, Monroe County, New York (Figures 1 and 2). The City secured grants from the United States Environmental Protection Agency's (USEPA's) Brownfield Assistance Program to partially fund investigation and remediation of the Site. The City has also secured a State Assistance Contract under the NYSDEC's Environmental Restoration Program (ERP) to assist with funding RI and IRM work not covered under the EPA grants. The City has also made significant capital investments in the restoration of this property in addition to the partial funding required under the NYSDEC program.

The Site was historically developed with residential housing in the mid 1800's. The Site developed into manufacturing and industrial uses in the early 1900s. The Delco Appliance Division of General Motors occupied the Site from 1930 to 1967. The plant closed in 1967 and the property continued to be used for various industrial operations until 1990 when the Site was abandoned. The City acquired the Orchard Street parcel through tax foreclosure in 2000. In 2003, a large portion of the structures at the Whitney Street parcel was damaged during an arson fire. The City demolished the most heavily damaged structures in 2005 and foreclosed on the Whitney Street parcel in August 2006.

As the City initiated the RI in 2006, deteriorating and unsafe conditions relative to the structures at 354 Whitney Street and 415 Orchard Street warranted asbestos and hazardous materials abatement and demolition. This work was completed by the City in 2008 and 2009 to allow safe completion of SI activities and to mitigate concerns regarding potential trespassing and vandalism. The remaining building structure on the Site is the 415 Orchard Street "High Rise", which the City plans to demolish in early 2014. The footprint of this structure has been subdivided from the parcels making up the Site to allow completion of the SI and IRMs elsewhere on the Site under the NYSDEC's ERP.

SI and IRM efforts were completed in a phased process which prioritized the investigation of probable contaminant source areas to facilitate the development of effective IRMs as the SI process was underway. A total of eight (8) Areas of Concern (AOCs) were identified during the SI including:

- AOC-1:** Underground Storage Tanks (located on the west side of the 415 Orchard Street High-Rise)
- AOC-2:** Former Metal Plating Area (located immediately west of AOC-1)
- AOC-3:** Abandoned Hydraulic Lift (located in the north-central portion of the Whitney Street (open) parcel)

- AOC-4:** Former Gasoline Storage and Dispenser (located in the center of the Whitney Street Parcel)
- AOC-5:** Drain Systems (located beneath former buildings in the Whitney Street parcel)
- AOC-6:** Underground Tunnels and Buried Utilities
- AOC-7:** Former “Low-Rise” (footprint of former single-story building at 415 Orchard)
- AOC-8:** Former Coal Storage (located along southern Site perimeter)

AOCs are illustrated on Figure 3.

AOCs 4, 5, 6, 7 and 8 were determined to include conditions that did not require remediation. AOCs 1, 2 and 3 were determined to represent significant environmental liabilities to the Site warranting implementation of IRMs. Prioritization of AOCs relative to the associated environmental risks facilitated completion of IRMs designed to mitigate the most serious environmental concerns on the Site, and allowed completion of SI efforts associated with those areas which greatly reduced potential for human exposures or unnecessary release of contaminants into the environment.

AOC-related IRM efforts focused on closure of nine (9) underground storage tanks (USTs) and the removal, off-Site disposal and in-Situ remediation of soil and groundwater contaminated with chromium, arsenic and cadmium. IRM activities are summarized in the Final Engineering Report (FER) submitted to the City concurrently with the SI/RAR. A summary of the hazardous and non-hazardous wastes removed from the Site as part of the completion of IRMs relative to AOCs identified during the SI is provided by the following table.

**IRM Quantity Summary (2010-2012)**

<b>IRM WASTE STREAMS</b>	<b>WASTE QUANTITY</b>	<b>ASSOCIATED AOC</b>
UST Waste Products (Petroleum and Solvents)	14,245 gallons	AOC-1
Non-Hazardous Tank Bedding Materials	213.28 tons	AOC-1
Hazardous Tank Bedding Soil	14.6 tons	AOC-1
UST Cleaning Residues	1,110 gallons	AOC-1
Non-Hazardous Soils (Including Chimney Ash)	533.65 tons	AOC-2
Hazardous Soils	127.05 tons	AOCs-1 & 2
Decontamination and Purge Water	100 gallons	AOCs-1 & 2
Frac Tank Cleaning Residues	55 gallons	AOC-1
Chimney Base Waste Water	555 gallons	AOC-2
Petroleum-Contaminated Soils	5 tons	AOC-3

IRMs were also completed during the early stages of the SI between 2006 and 2009 as part of the demolition of both 354 Whitney Street and the “Low Rise” portion of 415

Orchard Street. IRM materials disposed of other than asbestos and hazardous building components remediated by Lu Engineers on behalf of the City during this period are indicated on the following table.

**IRM Wastes (Pre 2010)**

<b>CONTAINERS</b>	<b>CONTENTS</b>
1 - cubic yard box (lined)	Waste circuit boards contaminated with asbestos
1 – 30 gallon polyethylene drum	Sand blast waste
1 – 55 gallon fiber drum	Paint-related wastes
1 – 55 gallon fiber drum	Paint-related wastes
1 – 55 gallon fiber drum	Paint-related wastes
1 – 55 gallon fiber drum	Paint-related wastes
1 – 5 gallon bucket	Aerosol paint waste
1 – 55 gallon steel drum	Waste circuit boards contaminated with asbestos
1 – 55 gallon steel drum	Waste circuit boards contaminated with asbestos
1 – 55 gallon steel drum	Oil from large transformers (Transformer/Lube Oil)
1 – 55 gallon steel drum	Spill cleanup materials and soil with asbestos
1 – 85 gallon plastic overpack	Waste oil with lead
1 – 85 gallon plastic overpack	Waste oil (Transformer/Lube Oil)
1 – 85 gallon plastic overpack	Acidic boiler treatment
1 – 85 gallon plastic overpack	Caustic cleaner material
1 – 85 gallon plastic overpack	Propylene glycol

SI work on this project has included surface soil sampling, soil borings, test pit installation and groundwater monitoring well installation and sampling. Findings from these efforts are summarized herein and have provided adequate data to determine the extent of contaminated soil and groundwater within the boundaries of the Site. Sampling of surface soils, subsurface soils and groundwater in the immediate vicinity of the Site has also been completed, allowing determinations as to background conditions and the potential for off-site migration of target contaminants from and/or toward the subject properties.

Based on current zoning, past use and likely future use of the site, 6NYCRR Part 375 Commercial Use Soil Cleanup Objectives (SCOs) were deemed appropriate for the Site for comparison of sample analytical results. These standards were also applied as the cleanup criteria for remedial confirmatory sampling. The applicable NYSDEC Groundwater Standards found in 6NYCRR Part 703 were used to evaluate Site groundwater conditions. Tabulations of all analytical data and applicable regulatory criteria are provided herein.

Resource Conservation and Recovery Act (RCRA) metal contaminated soils remain on the Site as a result of past metal finishing operations. In particular, chromium is present at levels exceeding 6NYCRR Unrestricted Use SCOs in each subsurface sample obtained. Groundwater contamination by RCRA metals is less prevalent, but exceedances remain

in several locations. Exceedances of Commercial Use SCOs are present in soils sampled from several locations, including off-Site surface soils, for RCRA metals and semi-volatile organic compounds (SVOCs). No exceedances of Commercial Use SCOs for polychlorinated biphenyls (PCBs) have been observed in soils during the SI. Several exceedances of applicable groundwater criteria are also present for RCRA metals and a limited number of volatile organic compounds (VOCs). No elevated levels of SVOCs or PCBs have been detected in groundwater at the Site.

Hazardous waste level contamination identified in soil and groundwater during the initial phases of the SI was mitigated by the implementation of several IRMs. Hazardous waste level contamination of soil or groundwater is no longer present at the subject Site.

Contaminant sources identified and mitigated during the SI and IRM process included petroleum and solvent storage systems, past metal finishing/plating operations, hydraulic systems, industrial drainage systems, an abandoned coal-fired boiler plant, various electrical equipment and widespread asbestos-containing materials. Each of these issues was investigated and mitigated as IRMs were completed if warranted by the severity of the contaminants identified.

Recommendations for future work include development of a Site Management Plan to provide a clear means of identifying areas of the Site with residual contamination that may require special handling and/or disposal. The SMP will also specify procedures to be followed if contaminated media is encountered during future Site use or redevelopment.

It is also recommended that the concrete slabs remaining on the ground surface throughout much of the property remain in place for as long as practicable to prevent potential dust generation in dry periods and to prevent potential human exposure to potentially contaminated media in the subsurface.

## 1.0 Introduction and Site Background

Lu Engineers has prepared this Site Investigation/Remedial Alternatives Report (SI/RAR) for the City of Rochester (the “City”) Division of Environmental Quality (DEQ) for submission to the New York State Department of Environmental Conservation (NYSDEC) Region 8 Division of Environmental Remediation (DER). This report has been prepared in accordance with the “Municipal Assistance for Environmental Restoration Projects” Procedures Handbook and DER-10 “Technical Guidance for Site Investigation and Remediation.”

The City received a State Assistance Contract (SAC) under the NYSDEC 1996 Clean Water/Clean Air Bond Act - Environmental Restoration Program (ERP) for the Orchard Whitney Site #E828123 (the “Site”) located in the City of Rochester. The City was also awarded grants from the USEPA to complete investigation and remedial activities as part of this project. The City used these funds to complete investigative work and interim remedial measures as described in the NYSDEC-approved *Remedial Investigation Work Plan, August 2006, Interim Remedial Measures Work Plan, September 2007, and the Remedial Investigation and Interim Remedial Measures Work Plan, February 2011*, by Lu Engineers.

The purpose of this report is to document the investigation process and present findings of the Site investigation (SI) conducted by Lu Engineers on behalf of the City at the Orchard Whitney Site and adjacent off-Site (City-owned) properties. This report also includes a qualitative evaluation of alternatives for addressing environmental impacts.

### 1.1 Site Description

The Orchard-Whitney Site is a 3.9-acre site consisting of two parcels: 415 Orchard Street and 354 Whitney Street, in the City of Rochester (Figures 1 and 2). The Site lies within the City’s LYLAKS (Lyell-Lake-State Street Corridor) Brownfield Opportunity Area (BOA) that includes mixed residential and commercial/industrial uses.

The Whitney Street parcel is currently a fenced vacant lot covered mainly with concrete slabs and debris piles. Demolition of all structures on the 354 Whitney Street parcel was completed in 2008. Crushed masonry, brick, concrete and stone building materials generated during the demolition process are staged along the southern edge of the Whitney Street parcel. A smaller berm of similar material is also present along the western Site perimeter.

A seven (7) story masonry structure of approximately 371,600 square feet (ft) remains on the Orchard Street parcel (“High Rise”). An adjacent, heavily dilapidated single-story structure (“Low-Rise”) was demolished by the City in December 2009. The footprint of the 415 Orchard Street “High Rise” is in the process of being subdivided from the

adjoining parcels to facilitate processing of the RI findings with respect to the majority of the Site in lieu of future investigation of subsurface conditions within the building's foot print. This area of the Site remains inaccessible due to the presence of large amounts of friable asbestos within the structure. The parcels currently comprising the Site are indicated on the Site Survey Plan provided as Appendix A.

The Site is bordered by Orchard Street to the east, a former railroad right-of-way to the south, Whitney Street to the west, and commercial buildings with frontage on Lyell Avenue, to the north.

## **1.2 Site History**

According to previous environmental reports for the Site, the area was originally developed with residential housing in the mid 1800's. Railroad spurs were extended through the southern adjacent properties circa 1875 and the tracks were used for coal and metal delivery and shipping as the Site and surrounding properties developed into manufacturing and industrial uses in the early 1900s. From 1915 to 1922, the North East Electric Company occupied the Site.

The Delco Appliance Division of General Motors occupied the Site from 1930 to 1967 and had several processes including the manufacture of electrical equipment, various metal finishing operations, coal storage, boiler operation, power generation, petroleum storage and industrial waste water treatment. The facility was expanded to its pre-demolition size and configuration by 1935. The plant closed in 1967 and the property continued to be used for metal finishing, synthetic foam production, printing, plastics manufacturing, electronic manufacturing, and warehousing until 1990 when the Site was abandoned. Figure 3 includes the layout of the former factory buildings located on the Site prior to demolition.

After the cessation of commercial use of the Site in 1990, the Site conditions have continued to decline and in 2003, a large section of the structures on the Whitney Street parcel were heavily damaged during an arson fire. The City partially demolished the structure in 2005 to reduce the risk of collapse and to eliminate other hazardous conditions at the Site. The City foreclosed on the Whitney Street parcel in August 2006.

## **1.3 Previous Field Investigations**

The Site has undergone a series of environmental investigations since the late 1990's in order to assess Recognized Environmental Concerns (RECs) at the Site. These investigations include:

- Draft Center City Industrial Park Facility Assessment, *Flint, Allen, White & Radley*, April 1999;

- Phase I Environmental Site Assessment (ESA): 354 Whitney Street and 367, 370, 406, and 415 Orchard Streets, *Day Environmental, Inc.* December 2000;
- Pre-Demolition Asbestos Inspection of 354 Whitney Street Bldg 1A, *ENSR International*, August 2003;
- Pre-Demolition Asbestos Inspection of 354 Whitney Street Bldg 2/2A/ Brick Mill, *ENSR International*, August 2003; and
- Orchard-Whitney Targeted Site Assessment Report, *NYSDEC Region 8*, December 2006.

IRMs completed during the time period before the Site was entered into the State's ERP also included:

- United States Environmental Protection Agency (USEPA) Hazardous Substance Removal Action, 1999
- Demolition of the western portions of the 354 Whitney Street buildings in 2003

#### Draft Center City Industrial Park Facility Assessment, 1999

The Flint, Allen, White & Radley Draft Center City Industrial Park Facility Assessment consisted of visual inspection and analysis of general structural and Site conditions including interior and exterior roof conditions, floor loading potential and an estimated cost for rehabilitation and/ or demolition.

#### USEPA Hazardous Substance Removal Action, 1999

Numerous drums containing suspected hazardous wastes were found in the abandoned 354 Whitney Street building during an inspection conducted by the City and NYSDEC. NYSDEC requested that the USEPA characterize and remove the abandoned wastes to mitigate the significant environmental and human health hazard posed by these substances. USEPA removed and disposed of over 700 drums of various sizes during this removal action. This building was later gutted by fire and subsequently demolished by the City in 2005.

#### Phase I ESA, 2000

The results of the Day Environmental, Inc. Phase I ESA identified several RECs including:

- The presence or former presence of petroleum or chemical underground storage tanks (USTs), the locations and removal of which could not be confirmed. Laboratory analysis of samples from pre-existing monitoring wells at the Site indicated that petroleum, heavy metals and chlorinated contaminants were present in groundwater above regulatory guidance values;
- The presence of suspected and confirmed asbestos containing materials (ACM) throughout all structures at the Site;

- Historical uses of the properties and adjacent properties which suggested the use, storage and generation of Resource Conservation and Recovery Act (RCRA) hazardous wastes such as: oil and lead based paints, lubricants, flammable liquids, heavy metals, and PCB oils. In addition, the Site is known to have at least two (2) documented NYSDEC spill incidents;
- Visual evidence of additional spills in locations where numerous drums of unknown materials were being staged;
- The presence of several transformers, hydraulic lifts, and other motorized equipment commonly associated with PCB contaminated oils; and
- The presence of floor drains and/ or sumps throughout the buildings containing unknown liquids, chemicals and residues. The discharge points of the drains and sumps could not be confirmed.

Figure 4 identifies the locations of the findings of the Day Phase I ESA.

#### Asbestos Pre-demolition Surveys, 2003

The ENSR International, Inc. Pre-Demolition Asbestos surveys of the structures on the Whitney Street parcel conducted in 2003 indicated that friable and non-friable asbestos was present throughout all Site buildings including: roofing and flooring materials, window glazing, pipe insulation, wall board and insulation. Portions of the Site were already in decline, and friable asbestos was present where roofing materials had collapsed, windows were vandalized and pipe and wall insulation was damaged.

#### NYSDEC Investigation, 2005

The NYSDEC conducted a Targeted Site Assessment in the Fall of 2005 to evaluate the Site for potential registry as an Inactive Hazardous Waste Disposal Site (IHWDS). The assessment consisted of:

- A geophysical survey to determine the location of buried metallic anomalies such as USTs or utilities;
- A utility survey to locate major utility right-of-ways and to identify potential contaminant pathways;
- Installation of soil borings/ monitoring wells to assess subsurface soil and groundwater quality and flow direction;
- Collection of surface soil samples to determine the potential for direct contact exposure to contaminants; and
- Collection of basement standing water samples to determine whether it was a source of contamination to groundwater.

The results of the NYSDEC investigation indicated surface soil samples were contaminated with SVOCs and PCBs, as well as metals. The investigation was inconclusive as to the source, nature and extent of any subsurface soil or groundwater contamination at the Site. The Site was not listed on the IHWDS registry; however,

further investigation was recommended to fully evaluate conditions at the Site. The location of USTs or other potential contaminant source areas were not identified during this investigation.

## 2.0 Investigation Activities

The Study Area for this investigation consisted of two (2) parcels, 415 Orchard Street and 354 Whitney Street, and was selected in accordance with recommendations by the NYSDEC to provide current Site information for further evaluation of the nature and extent of contaminants present at the Site. It is noted that the footprint of the 415 Orchard “High Rise” is in the process of being subdivided from the adjoining parcels to facilitate processing of the SI findings with respect to the majority of the Site in lieu of investigation of subsurface conditions within the building’s foot print. This area of the Site remains inaccessible due to the presence of large amounts of friable asbestos within the building.

A variety of SI efforts and IRMs have been completed at various times since Lu Engineers was retained by the City in July 2006. This iterative approach was necessary due to the fact that RI and IRM work needed to be coordinated with the demolition of 354 Whitney Street in 2008 and the “Low-Rise” portion of 415 Orchard Street in 2010. IRMs were required to allow demolition in certain cases and to facilitate access to areas of the Site requiring additional SI work. IRM and SI efforts to date have been summarized as they were completed in memoranda and correspondence provided to the City, NYSDEC and NYSDOH, as necessary.

Lu Engineers initiated the SI in 2006 with detailed inspections of the remaining structures on the Site. In addition to focusing on the imminent demolition of the remaining structures at 354 Whitney Street, all above and below-grade structures at the Site were investigated in conjunction with detailed review of available record plans provided by the City. A significant goal of the RI at this time was the identification and mitigation of contaminant source areas and potentially contaminated and/or hazardous materials contained in buildings targeted for demolition.

A number of qualified contractors and laboratories have been utilized for the SI and IRM efforts relative to the Orchard Whitney Site. Lu Engineers retained each of the subcontracted companies through a competitive bidding process overseen by the City and NYSDEC. Contractors and laboratories utilized for the SI tasks include the following:

<u>Subcontractor</u>	<u>Work Performed</u>
Paradigm Environmental Services, Inc.	Analytical services
Test America, Inc.	Analytical services
Paragon Environmental Services, Inc.	Drilling and test pits
Trec Environmental Services, Inc.	Test pits
Nothnagle Drilling, Inc.	Drilling
Jamko, Inc.	Utility assessment
GeoHydros, Inc.	Assistance with contaminant modeling
Nancy Potak	Data Validation

Prior to beginning intrusive work, the Underground Facilities Protective Organization (UFPO) was contacted by each contractor at each iteration of the SI and IRM process. Private utilities and agencies were contacted separately.

## **2.1 Pre-Demolition Phase Investigation and IRMs (2006-2007)**

Lu Engineers conducted a detailed inspection of the structures located on the Site at that time including the 415 Orchard Street “High” and “Low-Rise” as well as the various contiguous structures remaining at 354 Whitney Street. This investigation was conducted in accordance with the approved *Remedial Investigation Work Plan (August 2006)* in order to locate and characterize hazardous or contaminated materials that required removal prior to, or concurrently with, demolition.

The pre-demolition investigation was completed in February 2007 and included the following:

- PCB assessment of all existing facility equipment including, but not limited to, hydraulic lifts, electrical equipment, ballast and bulbs, oily residues in facility drip pans, melt-water and flooding in the Engine Room of 354 Whitney Street, and liquid materials in floor drains and trenches;
- A full hazardous materials inventory including sampling for waste characterization to identify all materials requiring appropriate disposal prior to demolition;
- A limited lead inspection and sampling for both 354 Whitney Street and 415 Orchard Street; and
- An asbestos pre-demolition survey at 415 Orchard Street.

### **2.1.1 PCB Assessment**

The first SI measure taken on the Site was the 2006 completion of an assessment of the occurrence of PCBs with the buildings present on the Site at that time. Site conditions documented in previous investigations indicated the presence of stained areas where former transformers and other electrical equipment was located. In addition, water had flooded portions of the lower level of the powerhouse on the Whitney Street parcel. Drainage from rain and snow melt entered the trenches and drains in the building creating the possibility for PCBs to contaminate the water. Samples of various media were collected from a total of 19 locations during this process.

None of the surface wipes, concrete chip samples, water or oil samples contained PCBs at regulated levels. A report was developed on the findings of this effort, which includes detailed descriptions of sampling methods and procedures for sampling activities. This report is included as Appendix B.

### 2.1.2 Hazardous Materials Inventory and Characterization

Concurrently with the PCB Assessment, a room by room Hazardous Materials Inventory was conducted in all buildings to identify and quantify suspected hazardous materials and to characterize the materials for proper disposal. Research of Material Safety Data Sheets (MSDS) or related databases to facilitate disposal was also conducted. The inspection included assessment of underground tanks, vaults, or cisterns, electrical/mechanical equipment, drummed and containerized waste, residual coal, ash and miscellaneous waste abandoned on-Site.

Other potential hazardous materials contained in building components were inventoried as part of the Whitney Street building demolition process and included:

- Drained oils from equipment and or containers, disposed of as waste oil;
- Sandblast material located in the sandblast hood in the vehicle repair bay;
- Ash material from the boiler, the flue duct leading from the boilers to the stack, and from the inside of the stack;
- Sediment in the north floor drain of the vehicle repair bay;
- Six (6) unknown drums and eighteen (18) empty drums were located in a tunnel beneath the former Building 3;
- One (1) unknown wooden drum and one (1) 55-gal oil drum were located in the boiler room, and one (1) 55-gal drum was located in the northwest portion of the second floor. Also, approximately ten (10) small 3 to 5-gal containers were located on the mezzanine level of the second floor near the South East staircase;
- Potential hazardous materials may have been contained in the debris piles;
- 130 PCB containing ballasts and 160 unknown but suspect PCB containing ballasts;
- 200 fluorescent bulbs;
- Three (3) transformers located on the 6<sup>th</sup> floor exterior of the Orchard Street Building between the southeast staircase and the south east elevator;
- Various paint containers;
- Approximately twenty (20) bags of populated circuit board wastes; and
- Pigeon droppings in varying amounts on the majority of interior building surfaces.

Samples of the unknown and/ or potential hazardous materials were collected on August 30 and 31, 2006. Additional samples were also collected on September 8, 2006 and October 16, 2006.

Results of the hazardous materials inventory were summarized in a memorandum *Orchard/Whitney Hazardous Materials Inventory Sampling Results* (Lu Engineers, February 2, 2007) submitted to the City. A copy of the memorandum is included in Appendix B.

### **2.1.3 Limited Lead Survey**

An EPA-certified Lead Risk Assessor from Lu Engineers conducted the Limited Lead Inspection on August 30, 2006. Several surfaces with damaged paint were sampled for lead content. In addition, lead dust wipe samples were collected from floor areas adjacent to damaged paint. A total of ten (10) lead paint chip samples and two (2) lead dust wipe samples were collected. In addition, one (1) lead dust wipe control sample was collected.

The samples were submitted to an Environmental Laboratory Accreditation Program (ELAP), National Voluntary Laboratory Accreditation Program (NVLAP), and American Industrial Hygiene Association (AIHA) certified laboratory. The samples were analyzed for total lead content by EPA Method 7420.

Detailed descriptions of sampling methods and results for all sampled media were provided to the City in the following reports:

- *Limited Lead Inspection Technical Memorandum, Abandoned Property Located at 415 Orchard Street*, Lu Engineers, November 27, 2006
- *Limited Lead Inspection Technical Memorandum, Abandoned Property Located at 354 Whitney Street*, Lu Engineers, November 27, 2006

Copies of these documents are included in Appendix B.

### **2.1.4 Pre-Demolition Asbestos Survey (Orchard Street Parcel)**

A Pre-demolition asbestos survey of the “High” and “Low Rise” structures on the Orchard Street parcel was conducted by a New York State Department of Labor (NYSDOL) certified Asbestos Inspector in August 2006 to identify and quantify materials suspected to contain or be contaminated with asbestos. Approximately two hundred forty (240) bulk samples were collected from all suspect Asbestos Containing Materials (ACMs). Samples were collected in accordance with Asbestos Hazard Emergency Response Act (AHERA) regulations, 40 Code of Federal Regulations (CFR) Part 763.86 and 763.87 and NYS Code Rule 56-5.1.

Samples were relinquished to an approved NYSDOH and federally accredited NVLAP, National Institute of Standards and Technology (NIST), AIHA laboratory for analysis. Friable samples were analyzed using NYS ELAP Method 198.1 (Polarized Light Microscopy (PLM)). Non-friable organically bound (NOB) samples were analyzed using NYS ELAP Method 198.1 (PLM) and/or NYS ELAP

Method 198.4 (Transmission Electron Microscopy (TEM)). This document was submitted to the City upon completion in 2006.

Applicable requirements with respect to the pre-demolition survey and abatement of asbestos containing materials during demolition of the 354 Whitney Street building were addressed by others under separate contract as part of the demolition process.

#### **2.1.5 Demolition Inspection and IRMs**

The City contracted for asbestos abatement and demolition of the 354 Whitney Street structure in 2008 under a separate program. Lu Engineers provided oversight and community air monitoring during the demolition process.

Small amounts of abandoned waste paints, oils and boiler chemicals were disposed of prior to demolition. Other materials were characterized for removal during demolition by Titan Wrecking and Environmental, LLC (Titan) as part of their demolition contract with the City. It is noted that the City completed an asbestos pre-demolition survey and contracted for third party air/project monitoring during the entire 354 Whitney Street demolition process under separate contracts. Lu Engineers provided all subsequent asbestos assessment, abatement design and monitoring services for this project.

Three (3) non-PCB-containing transformers located on the outer wall of the 6<sup>th</sup> floor of 415 Orchard Street were also removed and disposed of to prevent them from potentially falling during demolition of the adjacent structure. Vandalism required cleanup of spilled non-PCB oils from the ground surface as part of this process. After demolition of the 354 Whitney structures, a total of 218 tons of ash containing hazardous waste levels of arsenic from the boiler house chimney was transported and disposed of off-Site. This effort was also completed under Titan's demolition contract.

Masonry demolition debris was crushed to approximately 4-6 inches in diameter and staged on Site above the existing pile of demolition debris left after demolition of the westernmost portions of the 354 Whitney Street complex in 2003. Crushed masonry demolition debris was also staged along the western perimeter of the Site along Whitney Street at that time. This debris is also referred to as the "berm" as illustrated on Figure 5. Surface cover types at the Site (concrete, asphalt, etc.) are indicated as well as the location of the berm(s) on Figure 6.

## 2.2 Post-Demolition Phase Site-Wide Investigation (2008-2009)

Once the remaining 354 Whitney Street structures were demolished, the majority of the Site was accessible, and a more comprehensive intrusive investigation was possible. In accordance with the approved *Remedial Investigation Work Plan (August 2006)*, the following activities were performed:

- Excavation of eighteen (18) test pits (TP-01 through TP-18)
- Completion of twenty-one (21) soil borings
- Collection of five (5) off-Site background soil samples (SB-01, MW-08, SB-03, MW-09, and SB-05)
- Collection of four off-Site (4) surface soil samples (SS-01 through SS-04)
- Installation, development, and sampling of sixteen (16) monitoring wells (MW-07 through MW-22)

Sample locations are shown on Figure 5.

### 2.2.1 Test Pits

An initial test pit investigation was completed on October 1-3, 2008 to evaluate subsurface conditions across the Site. This investigation was completed to provide a preliminary evaluation of the nature and extent of contamination associated with identified areas of concern including: known locations of former petroleum or chemical storage and handling; locations of reported surface spills or staining; floor drains, sumps, trench drains; and areas containing electrical equipment and hydraulic lifts. The following is a summary of the areas investigated by test pit excavations including:

- Surface and subsurface conditions associated with one former in-ground hydraulic lift, one floor drain located in the northwest corner of the 354 Whitney Street building, (see Figure 5/TP-03), and one floor drain located at the former location of the northeast portion of 354 Whitney Street Building (TP-01, TP-02 and TP-03);
- Holes in the central building slab (TP-04);
- The area of the toe of the berm containing demolition debris on the southern portion of the Whitney Street Parcel (TP-05, TP-14 and TP-15);
- Former floor drains and along the Tunnel (TP-06, TP-11,TP-12, and TP-13);
- The central portion of the Site, investigated in order to delineate residual petroleum contaminated soil at TP-07;
- Surface and subsurface conditions associated with pipes of unknown purpose located on the east side of the remaining portion of 354 Whitney Street (TP-08 and TP-9);

- Subsurface conditions associated with a potential former 5,000-gallon gasoline UST and dispenser located on the west side of the north courtyard of 354 Whitney Street (TP-10);
- Area of northwestern tunnel (TP-16);
- Surface and subsurface conditions associated with suspected PCB-containing electrical equipment located in the engine room of 354 Whitney Street (TP-17);
- Surface and subsurface conditions associated with demolition debris located on the south side of the boiler room at 354 Whitney Street (TP-18);

Test pits were excavated by Paragon Environmental Construction, Inc. (Paragon) using a 200-series Komatsu excavator equipped with a jack-hammer to investigate sub-slab features. Headspace screening measurements were recorded using a MiniRae 2000 portable photoionization detector (PID) meter.

Soil samples were collected from each test pit. Visual observations, characterization of subsurface materials, and field measurements of volatile organic compounds (VOCs) were recorded on test pit logs (Appendix C).

**Site-wide Test Pits (2008)**

Test Pit	Depth of Sample Collected	Peak PID Reading <sup>1</sup>
TP-01	4.0 ft bgs (TP-01A)	15 ppm
TP-02	5.5 ft bgs	0 ppm
TP-03	9.0 ft bgs	15 ppm
TP-04	10.0 ft bgs	15 ppm
TP-05	8.0 ft. bgs. (TP-05A)	0 ppm
TP-06	4.0 ft bgs	28.5 ppm
TP-07	4.0 ft bgs	400 ppm
TP-08	9.0 ft bgs	0 ppm
TP-09	9.0 ft bgs	0 ppm
TP-10	9.4 ft bgs	0 ppm
TP-11	9.5 ft bgs	0 ppm
TP-12	No sample collected	0 ppm
TP-13	No sample collected	0 ppm
TP-14	8 ft bgs	0 ppm
TP-15	6 ft bgs	950 ppm
TP-16	No sample collected	0 ppm
TP-17	10.5 ft bgs	0 ppm
TP-18	3 ft bgs (in brick fill)	0 ppm

1 – Does not necessarily correspond to sample depth

Soil samples were collected for laboratory analysis from each test pit, except for TP-12, TP-13, and TP-16 where conditions or proximity to other data points precluded the necessity for sampling. Results of the test pit investigation are summarized in Section 4.0 and Tables 1-1 and 1-2.

The location of each test pit was surveyed by a Lu New York State Licensed Surveyor using NAD 1983 State Plane New York West Coordinates. Test pit locations are indicated on Figure 5.

**2.2.2 Background Soil Borings**

Five (5) soil borings were advanced on September 23-25, 2008 at off-Site locations in order to establish local background concentrations of VOCs, SVOCs and RCRA Metals. Two (2) of these borings were completed as monitoring wells (MW-08 and MW-09) to monitor up-gradient and down-gradient groundwater conditions. Background soil samples were collected from locations shown in the following table.

**Background Soil Borings**

Soil Boring/Monitoring Well Location	Peak PID Reading (ppm)/Depth	Total Boring Depth
SB-01	7.7/6.5 ft	7 ft
MW-08 (SB-02)	0.2/2.5 ft	17 ft
SB-03	0 ppm	10.6 ft
MW-09 (SB-04)	0 ppm	19.2 ft
SB-05	0 ppm	10.7 ft

Background boring locations are shown on Figure 5. Subsurface soil samples were collected continuously via split-spoon in accordance with American Society for Testing and Materials (ASTM) Method D-1586 and characterized according to the Burmeister Soil Classification System. Samples were collected using a standard 2-inch outer diameter (OD) split-spoon driven by a 140-pound drill rig hammer. Blow counts and split-spoon samples were logged by a geologist and recorded on boring logs for reference. Field headspace measurements of VOCs from soil split-spoon samples were recorded using a MiniRAE 2000 portable PID meter. Boring logs are included in Appendix D.

One (1) soil sample was collected from each location and submitted for laboratory analysis of TCL VOCs, SVOCs, TAL Metals, and PCBs. Soil samples were typically collected from the vadose zone (6-8 feet below grade) unless otherwise indicated. Results are summarized in Section 4.0 and the attached Tables 1-1 and 1-2.

**2.2.3 Site-Wide Soil Borings and Sampling**

A total of sixteen (16) borings (SB-06 through SB-21) were completed on-Site by Paragon from September 25 - October 6, 2008 using 4.25-inch ID hollow-stem augers. Monitoring wells were installed at all boring locations, except for SB-07, SB-19, and SB-20 where conditions or proximity to other data points precluded

the necessity for well installations. Sampling relative to soil borings was conducted as shown on the following table.

**Site-wide Soil Borings (2008)**

Soil Boring/Monitoring Well Location	Peak PID Reading (ppm)/Depth	Total Boring Depth
MW-10 (SB-06)	0 ppm	13.4 ft
SB-07	0 ppm	11 ft
MW-11 (SB-08)	0 ppm	10.5 ft
MW-12 (SB-09)	0 ppm	9.3 ft
MW-13 (SB-10)	0 ppm	8.7 ft
MW-14 (SB-11)	0 ppm	15 ft
MW-15 (SB-12)	0 ppm	15.5 ft
MW-16 (SB-13)	0 ppm	24.9 ft
MW-17 (SB-14)	0 ppm	16 ft
MW-18 (SB-15)	0 ppm	11.2 ft
MW-19 (SB-16)	0 ppm	9.5 ft
MW-20 (SB-17)	101 ppm @ 8 ft	12 ft
MW-21 (SB-18)	0 ppm	13.3 ft
SB-19	1.3 ppm @ 5.5 ft	18 ft
SB-20	0 ppm	14.5 ft
MW-22 (SB-21)	0 ppm	11 ft

Boring locations are indicated on Figure 5. Subsurface soil samples were collected continuously via split-spoon in accordance with ASTM Method D-1586 and characterized according to the Burmeister Soil Classification System. Samples were collected using a standard 2-inch outer diameter (OD) split-spoon driven by a 140-pound drill rig hammer. Blow counts and split-spoon samples were logged by a geologist and recorded on boring logs for reference. Field headspace measurements of VOCs from soil split-spoon samples were recorded using a MiniRAE 2000 portable PID meter. Boring logs are included in Appendix D.

Soil samples were typically collected from the vadose zone (6-8 feet below grade) at each boring location. All soil boring soil samples were analyzed for TCL VOCs, SVOCs, TAL Metals, and PCBs. Soil sample results are summarized in Section 4.0 and the attached Tables 1-1 and 1-2.

#### **2.2.4 Monitoring Well Installation and Development**

Paragon installed fifteen (15) new monitoring wells (MW-08 through MW-22) from September 25 - October 6, 2008. [Note: wells MW-1 through MW-7 were installed during previous investigations]. Monitoring well locations were selected to provide representative data relative to conditions throughout the Site. The wells were installed in areas of known former petroleum or chemical

storage and handling, locations of reported surface spills or staining, floor drains, sumps or trench drains, areas containing electrical equipment or hydraulic lifts, and areas of concern identified or incompletely characterized during trenching or building demolition.

Monitoring wells MW-08, MW-09, and MW-10 were installed off-Site at down-gradient, up-gradient, and cross-gradient locations, respectively (Figure 5).

Overburden drilling was completed as described in Section 2.2.3 above. Upon reaching competent bedrock, boreholes were advanced using rotary techniques and coring. HQ rock cores were obtained from six (6) well bores (MW-10, MW-11, MW-12, MW-18, MW-21, and MW-22) to facilitate development of an accurate picture of Site-wide near surface bedrock hydrogeology via three-dimensional representations and profiles. Water for coring was obtained from a nearby fire hydrant under a permit issued by the City of Rochester. Investigation-related permits are included in Appendix E.

Drill cuttings and decontamination water generated during this phase of drilling were discharged to the ground surface. Wells were completed flush to grade and set in concrete curb boxes. Well construction diagrams are provided in Appendix D.

Newly installed monitoring wells and existing wells were developed on September 30 - October 8, 2008 by surging and pumping until turbidity of the discharge was 50 nephelometric turbidity units (NTU) or less. Field instrument measurements made during development were recorded on well development logs (Appendix F). Development water was discharged to the ground surface in the vicinity of the monitoring wells with the permission of the NYSDEC.

### **2.2.5 Groundwater Sampling**

A total of four (4) rounds of Site-wide groundwater sampling were completed during the course of this RI. The baseline groundwater sampling event was performed from October 4-7, 2008 to determine the local groundwater hydraulic gradient, establish baseline groundwater parameters, and to define the horizontal and vertical extent of any groundwater contamination at the Site. Five of the seven wells previously installed during the August 2005 NYSDEC Targeted Site Assessment were also sampled. It is noted that several of the NYSDEC-installed wells were inaccessible at the time of the 2008 groundwater sampling round. Subsequent rounds of groundwater sampling were performed in March 2009, September 2011, and December 2012.

Prior to sampling, the water level at each well was measured with reference to the casing elevation and recorded. Water was purged from each well using low-

flow methods until parameters stabilized. Field parameters including turbidity, pH, conductivity, dissolved oxygen and temperature were measured periodically and recorded on Low-Flow Groundwater Sampling Logs (Appendix F) prior to sample collection. Once these parameters had stabilized a representative water sample was collected. With permission of the NYSDEC, purged water was discharged to the ground surface in the vicinity of the well.

The first two rounds of groundwater samples (2008 and 2009) were analyzed for TCL VOCs + MTBE, TCL SVOCs, TAL Metals, and PCBs. Subsequent groundwater samples (2011 and 2012) were analyzed for TCL VOCs and RCRA Metals only. Once obtained, all samples were immediately labeled and placed on ice in a cooler in preparation for delivery to the contract laboratory. Analytical results from targeted investigation of the Plating Area in 2011 are presented in Section 2.3.2 and in Table 3. Analytical results from Site-wide groundwater sampling events are summarized in Section 4.0 and Table 3-1.

#### **2.2.6 Aquifer Testing**

Hydraulic conductivity testing was conducted at permanent monitoring wells MW-9, MW-10, MW-14, MW-16, MW-20 and MW-22 on March 10, 2009 to assist with hydrogeologic characterization of the Site. This testing method consisted of rising head slug tests and was conducted in accordance with the protocols outlined in the approved Work Plan. Hydraulic conductivity information and data including logarithmic graphs for the slug tests are presented in Appendix G.

Rising head slug tests were used to calculate hydraulic conductivity (K) and groundwater velocities. Hydraulic conductivity (the relative mobility of groundwater through soils) values were obtained using the Bouwer and Rice Method (1976) and AQTESOLV® for Windows Standard 3.5.

Each test was initiated by measuring and recording the static water level in the well. An In-Situ Level Troll 700 pressure transducer was then lowered into the well, positioned near the bottom of the well screen, and secured. A disposable bailer measuring 3 feet long by 1.5 inches in diameter (1 liter capacity) was then inserted into the well and the water level was monitored until it returned to static level. A hand-held "Rugged Reader" that connects to the pressure transducer was used to establish the aquifer test parameters, initiate and terminate the tests and store the resulting data.

Once the well returned to static level the test was initiated via the "Rugged Reader", logging the data transmitted from the Level Troll transducer to determine the hydraulic conductivity of the soils in the immediate vicinity of each well screen. The slug (bailer) was rapidly withdrawn from the well,

evacuating 1 liter of water. As the water level in the well rose back to static level the transducer measured the change in water displacement to the nearest 0.001 of a foot. The rising head data was recorded until the water level returned to approximately 90% of its initial static level.

Groundwater monitoring well elevation data and groundwater level measurements collected on March 10, 2009 were used to calculate groundwater elevations for each well tested. For this RI, the most recent (December 2012) set of elevation data were used to develop a groundwater potentiometric map, included as Figure 7. This data is considered the best representative information for the Site. Results of the aquifer testing and description of the Site hydrogeology is provided in Section 3.5.

### **2.2.7 Surface Soil Sampling**

In order to address potential land use restrictions, surface soil samples were collected from off-Site locations adjacent to the Site. The purpose of the surface soil samples was to supplement the surface soil sample data collected by the NYSDEC on the 354 Whitney Street parcel in 2005.

Surface soil samples were collected on October 14, 2008. Two (2) samples (OW-SS-03 and OW-SS-04) were collected from immediately east of the eastern edge of the Site along Orchard Street; and two (2) background samples were collected off-Site along the Whitney Street right-of-way (OW-SS-01 and OW-SS-02). Sample locations are shown on Figure 5. Grid-based sampling across the Site, as proposed in the approved work plan, was not performed since the entire surface of the Site is covered by concrete, asphalt, building foundations, and demolition debris piles.

The off-Site surface soil samples were collected using a dedicated pre-cleaned, stainless steel spoon to transfer the soil into the appropriate sample containers. The samples were collected from a depth of 0 to 2 inches below the vegetative cover.

The samples were analyzed for the presence of TCL VOCs, SVOC, TAL metals, and PCBs. Surface soil sample results are summarized in Section 4.0 and Table 2.

## **2.3 Area of Concern (AOC) Investigation and IRMs (2011-2012)**

Review of detailed building and site plans yielded valuable information regarding past operations at specific locations and allowed for strategic planning for further investigation at these locations. These targeted investigations were then used to develop and implement IRM plans as the SI progressed. Past industrial activities and

features identified by the preliminary SI work and previous research included the following potential environmental concerns:

- Bulk petroleum storage
- Metal finishing including plating and painting
- Solvent storage and use
- Hydraulic lift systems
- Gasoline dispenser system
- Industrial drainage systems
- Underground tunnels and buried utilities
- Coal-fired boiler plant
- Electrical equipment
- Asbestos
- Lead

Based on knowledge and location of past industrial operations as well as the City's concurrent demolition program, which mitigated the presence of a number of physical and chemical hazards, the SI was developed to characterize the Site with respect to the industrial activities identified above. A list of areas of concern (AOCs) was developed to allow grouping of environmental issues relative to contaminant types and occurrences typically associated with the identified past industrial activities. A total of eight (8) AOCs were originally identified:

- AOC-1:** Underground Storage Tanks (located on the west side of the 415 Orchard Street High-Rise)
- AOC-2:** Former Metal Plating Area (located immediately west of AOC-1)
- AOC-3:** Abandoned Hydraulic Lift (located in the north-central portion of the Whitney Street (open) parcel)
- AOC-4:** Former Gasoline Storage and Dispenser (located in the center of the Whitney Street Parcel)
- AOC-5:** Drain Systems (located beneath former buildings in the Whitney Street parcel)
- AOC-6:** Underground Tunnels and Buried Utilities
- AOC-7:** Former "Low-Rise" (footprint of former single-story building at 415 Orchard)
- AOC-8:** Former Coal Storage (located along southern Site perimeter)

The location of each AOC is indicated on Figure 3. The following sections provide brief descriptions of the findings in each AOC defined above.

Additional investigation and IRMs associated with these AOCs were performed in accordance with the *Remedial Investigation and Interim Remedial Measures Work Plan (April 2011)*. All IRMs were implemented with the prior approval of the NYSDEC and are

documented in the attached *Final Engineering Report* (Appendix H). Additional investigation activities included:

- Detailed evaluation of tunnels and underground utilities;
- Partial excavation of USTs to evaluate subsurface conditions;
- Excavation of twenty-three (23) additional test pits (TP-19 through TP-39 and TP-7A through TP-7E);
- High resolution test boring program within the former plating area;
- Installation and sampling of sixteen (16) mini-wells, including three nested pairs, within former plating area; and
- Installation of three (3) additional monitoring wells (MW-23 through MW-25).

As investigation continued and IRMs were implemented including concurrent demolition efforts by the City, the list of AOCs used for identification of grouped RI and IRM efforts was reduced to include only AOC-1, AOC-2 and AOC-3.

### **2.3.1 AOC-1: UST Investigation**

TREC Environmental, Inc. (TREC) was subcontracted by Lu Engineers, through a competitive bidding process to conduct UST evaluations, removals and disposal of contaminated media in AOC-1. The UST evaluation and removal IRM was completed between April 14, 2011 and June 1, 2011 with oversight provided by Lu Engineers. SI and IRM efforts were conducted concurrently during 2011 to minimize the mobilization and demobilization of equipment to and from the Site. IRM work focused on the closure of a total of nine (9) petroleum USTs located within AOC-1.

Preliminary SI results indicated the presence of several USTs located immediately adjacent to the western wall of the 415 Orchard St. high-rise building (Figure 3). UST investigation activity began on April 14, 2011, when TREC mobilized a 200 series excavator and removed an approximately 1 foot thick reinforced concrete slab situated above the first six USTs. Once all concrete was removed from above the tank farm, a total of nine (9) USTs were observed. The nine (9) tanks were contained within four separate concrete vault structures. It was evident that the tanks contained free product and were generally between  $\frac{3}{4}$  full and full. Liquid contents within each tank were sampled for waste characterization parameters to facilitate proper waste profiling and disposal. The FER (Appendix H) contains a summary of the findings of this sampling and profiling. None of the tanks were found to contain hazardous waste.

Upon completion of the tank evaluation process, tank vaults were temporarily covered by steel plates and secured with concrete and brick demolition debris to prevent vandalism, and to control health and safety hazards associated with the area. The tank farm was then covered by polyethylene sheeting to prevent

water infiltration until tank removals occurred. The following is a summary of the findings pertaining to each UST:

**UST Investigation Summary**

TANK NUMBER	CAPACITY	CONTENTS	TYPE	LOCATION
1	1,600 Gallons	Fuel Oil Mix (full)	Single-Walled Steel	Sand Bedding Within Concrete Vault 1-5
2	1,600 Gallons	Fuel Oil Mix (full)	Single-Walled Steel	Sand Bedding Within Concrete Vault 1-5
3	1,600 Gallons	Fuel Oil Mix (full)	Single-Walled Steel	Sand Bedding Within Concrete Vault 1-5
4	1,600 Gallons	Gasoline (3/4 full with 3-4" Water)	Single-Walled Steel	Sand Bedding Within Concrete Vault 1-5
5	1,600 Gallons	Mineral Spirits (1/2 full, < 1" Product)	Single-Walled Steel	Sand Bedding Within Concrete Vault 1-5
6	700 Gallons +/-	Water (1/3 full, Water Only)	Single-Walled Steel	Sand Bedding Within Concrete Vault 6
7	1,100 Gallons +/-	Mineral Spirits (3/4 full)	Single-Walled Steel	Sand Bedding Within Stone & Mortar Vault 7-8
8	1,100 Gallons +/-	Mineral Spirits (3/4 full)	Single-Walled Steel	Sand Bedding Within Stone & Mortar Vault 7-8
9	10,000 Gallons	#2 Fuel Oil (3/4 full, < 1" Product)	Single-Walled Steel	Sand Bedding Within Concrete Vault 9, Covered by Reinforced Concrete

All USTs and surrounding impacted bedding materials were removed as an IRM in May 2011. Tank removals are described in the *Final Engineering Report* (Appendix H).

**2.3.2 AOC-2: Plating Area Investigation**

The former plating area, AOC-2, is shown on Figure 3. Additional investigation in this area was focused on obtaining detailed data on the nature and extent of soil and groundwater contamination associated with AOC-2 for development of an IRM strategy.

As was the case for AOC-1, the southern portion of the adjacent former metal plating area (plating area) was covered by large amounts of brick building demolition debris. In March 2011, prior to investigation of AOC-2, the crushed demolition debris located south of MW-17 was removed by TREC as directed by Lu Engineers and relocated to the adjacent berm immediately south and west of this area with concurrence of the NYSDEC and the City. This allowed full access to the plating area for the investigative and remedial activities conducted.

Limited delineation to the west, north and east was provided by nearby wells, borings and test pits completed during the initial phase of the RI. Surface features located in the concrete slab covering the majority of AOC-2 and review of past environmental assessment documentation indicated that this location was used for plating metal car parts and related work. Initial soil and groundwater investigation in this area indicated the presence of high concentrations of hexavalent chromium ( $\text{Cr}^{+6}$ ) exceeding guidance values and regulatory criteria by several orders of magnitude.

The elevated chromium concentration in soil at TB -19 (584 mg/kg) and elevated concentration observed in groundwater sampled from MW-17 (32,300 ug/l), indicated the need for further delineation of the chromium levels in soil and groundwater in this area. It was inferred that unidentified, more highly contaminated soils in this area of the Site may have been acting as a source area for the observed groundwater contamination at MW-17. IRM efforts in 2008 and 2009 also indicated the likely presence of residual arsenic-contaminated sediments in this portion of the Site associated with chimney ash from the coal-fired boilers used for power generation and steam in the past.

#### AOC-2 Soil Borings

On July 5, 2011, a detailed investigation of the plating area was initiated. As indicated on Figure 4, a total of eighteen (18) additional soil borings (PA-01 through PA-18) were installed. Soil borings were installed by Nothnagle Drilling, Inc. (Nothnagle) using hollow stem auger methods, as defined in the approved Work Plan and QAPP. The borings were installed with a BK-81 drill rig (equivalent to a CME-75) in a 20-foot grid pattern throughout the plating area, including the adjacent former tank vault areas, in an effort to delineate known  $\text{Cr}^{+6}$ , arsenic and cadmium contamination in subsurface soils.

A four (4) foot macro-core sample barrel lined with an acetate sleeve was used for all continuous subsurface soil sampling in this area. The sampling barrel was advanced with a 140-lb hydraulic auto-hammer and blow counts were recorded for each four foot interval. Borings were advanced to auger refusal or bedrock, which ranged from approximately 16 feet to 36 feet below grade. Nothnagle decontaminated the drilling equipment and tooling using steam-cleaning methods in a decontamination pad between each boring location. Decontamination liquids were containerized and properly disposed of as indicated in the FER (Appendix H). Drilling spoils were staged on the north side of the Site building. The soils were placed on, and covered with, 6 mil polyethylene sheeting and later disposed of off-Site during the soil removal IRM.

### AOC-2 Soil Samples

Each soil sample was logged by a geologist and screened for the presence of volatile organics using a MiniRae 2000 PID. Soils were also screened at one foot increments for the presence of arsenic and chromium by means of a Thermo Scientific NITON XL3t 600 Series analyzer (x-ray fluorescence (XRF) testing). The manufacturer specifications indicated that this meter had detection limits for arsenic and chromium of 11 and 85 ppm (mg/kg), respectively. All data collected during this process was entered into the subsurface logs prepared for each boring location which are included in Appendix D.

Sample locations and depths were determined by the field team leader in concurrence with the City as work progressed. The decision regarding which samples were to be relinquished to the lab was based on screening results of the XRF instrument and field observations. A total of 27 soil samples obtained from discrete depths corresponding to selected XRF test intervals were analyzed for RCRA metals by Paradigm Environmental Services, Inc. (Paradigm), an ELAP-accredited laboratory.

Laboratory analytical results were used to confirm the results obtained with the XRF. Pre-IRM AOC-2 sample results are summarized in Table 1-3 and in Figure 8.1.

### AOC-2 Well Installation

Thirteen (13) of the AOC-2 borings were converted into temporary micro-wells to allow groundwater sampling for more complete source area delineation. Once each boring was advanced to auger refusal, a 1-inch diameter micro-well was installed to provide temporary access to groundwater for sampling and source area delineation. Wells were installed with 0.01-inch slotted screen and #4 quartz sand was used to fill the well boring annulus as the augers were withdrawn. Micro-wells were not installed in borings PA-05 or PA-06 due to lack of sufficient groundwater at depth of refusal. Borings PA-16 through PA-18 were installed outside of the plating area footprint and therefore, not completed as micro-wells. No gross indications of contamination were observed during the installation of these borings. In addition, sufficient data was available relative to conditions adjacent to the Plating Area from other nearby wells.

A nested pair of micro-wells were installed within each borehole at borings PA-08, PA-10 and PA-15. A low-permeability soil horizon was encountered at approximately 9 to 10 feet below grade throughout the footprint of the plating area which consisted primarily of silt. For each nested pair, a shallow well was set with a 2.5 to 5 foot long screen, beginning at approximately 10 feet in depth, on top of this silt layer. The nested deep wells were screened on top of the bedrock surface at depths ranging from 16 to 20 feet below grade.

### AOC-2 Groundwater Sampling

Each micro-well was allowed to stabilize for at least 12 hours prior to development and sampling. On August 15, 2011, following development, the sixteen (16) plating area micro-wells plus MW-16 and MW-17 were sampled by low-flow methods in accordance with the IRM Work Plan. All samples were analyzed by Paradigm for RCRA metals only. Water quality parameters such as temperature, pH, conductivity and turbidity were recorded on Low-Flow Groundwater Sample Logs (Appendix F).

Groundwater analytical data is presented in Tables 3 and 3-1.

### Chimney Base

Features associated with AOC-2 included remnants of the concrete base of the former chimney that was razed as part of the 354 Whitney Street demolition process in 2008. This chimney was part of the coal-fired boiler plant, which generated steam and electricity while industrial operations were occurring at the Site. The chimney base is located immediately adjacent to the northwest corner of the plating area as indicated on Figures 3, 4 and 5. The base measures 12 feet in outside diameter and extends down to its concrete floor 12 feet below the ground surface. It appears that the poured concrete floor and footer of this feature rests on the bedrock surface 16.5 feet below ground.

At the time of investigation, the chimney base was approximately  $\frac{3}{4}$  full of building demolition debris including: wood; brick; concrete; non-hazardous storm water; and coal ash. Ash contained in the aboveground portion of the chimney was disposed of in 2008 as part of the demolition of 354 Whitney Street. Representative samples of the solid and water contents within the structure were collected for proper characterization and disposal purposes. Two (2) ash samples obtained as part of the detailed investigation of AOC-2 were analyzed for TCLP Metals and pH and found to be non-hazardous. The FER (Appendix H) describes the initial removal of ash materials contained in the chimney immediately following demolition in 2008 as well as remediation and backfilling of the chimney base in 2012.

### Development of the AOC 2 IRM Model

Locations and elevations of the plating area micro-wells were established using traditional survey methods. Sample depths were logged and entered into the Site GIS geodatabase to facilitate data access and visualization (i.e., reporting and mapping). Graphical representations of contaminant occurrence were prepared to delineate soil removal areas. The mapping provided an indication of the depth of elevated metals concentrations exceeding applicable criteria, and was used as

a basis for determining more precise estimates as to volumes and quantities of environmental media to be addressed as an IRM. Figure 8.1 shows sample locations and analytical results for the detailed investigation of the Plating Area. Figure 8.2 includes a representative example of the modeling that was completed as part of this element of the RI.

The development of the selected IRM alternative for AOC-2 (excavation and disposal with in-situ aqueous  $\text{Cr}^{+6}$  reduction to  $\text{Cr}^{+3}$ ) and its implementation is presented in the FER included as Appendix G.

### **2.3.3 AOC-3: Abandoned Hydraulic Lift**

An abandoned hydraulic lift was identified, as AOC-3, in the north/central portion of the Site (Figure 3). The underground hydraulic lift and oil reservoir were removed as an IRM by TREC on July 2, 2011 during the UST removal work. OPTECH Environmental, Inc. (OPTECH) removed approximately 3 tons of petroleum-impacted soil from the former lift pit, at a depth of 9 to 11 feet, on April 4, 2012. AOC-3 removal activities are described in the FER located in Appendix H of the digital copy of this report.

Petroleum impacts were determined to be limited to soil immediately surrounding the former lift/reservoir. No additional investigation of AOC-3 was necessary.

### **2.3.4 AOC-4: Former Gasoline Storage and Dispenser**

Soil and groundwater analytical results in this area did not indicate the presence of elevated concentrations of contaminants of concern. However, elevated PID readings (>1,000 ppm) and petroleum odors were noted at TP-07 in the northern portion of the 354 Whitney Street parcel, warranting designation as AOC-4 (Figure 5). Previous environmental assessment work identified a gasoline dispenser pump in this area. It is inferred that these features may have been removed during demolition of the structures formerly located on the western portions of the 354 Whitney parcel.

Review of geophysical investigation findings conducted by Geomatrix, Inc. in 2005 did not confirm the presence of the previously noted 5,000-gallon UST or associated gasoline dispenser/piping suspected to be located in this area of the Site.

Additional test pit excavations (TP-7A through TP-7E) were completed in this area in March 2011 by TREC. Excavation depths varied from 1 to 20 feet (ft) below ground surface (bgs) depending on location, intent, soil characteristics, and depth to bedrock. Excavated material was returned to the appropriate test

pit after field screening and sampling was completed. The location of each test pit is indicated on Figure 5.

**AOC-4 Test Pits**

Test Pit	Depth of Sample Collected	PID Reading
TP-7A	No sample collected	52 ppm (3-8' bgs)
TP-7B	No sample collected	280 ppm (3.5-8' bgs)
TP-7C	No sample collected	0 ppm
TP-7D	No sample collected	30 ppm (3-4' bgs)
TP-7E	No sample collected	2.3 ppm (7-8' bgs)
TP-7F	No sample collected	54 ppm (7-8' bgs)

Soil and groundwater conditions within the area of AOC-4 were found to be consistent with background levels of VOCs, SVOCs and metals elsewhere on the Site and no additional IRMs were proposed. Samples from TP-7 A through F were not submitted for laboratory analysis based on previous analytical results obtained from TP-07. Prior sampling at TP-07 indicated no VOC contaminant exceedances, but 400 ppm during PID screening. The lower PID screening levels at TP-7A through F did not suggest the likelihood that elevated VOC analytical results would be observed.

**2.3.5 AOC-5: Drain System Evaluation**

Floor drains beneath the former buildings located within the Whitney Street parcel were observed during the 2008 test pit excavations. Two of the drains included clay sumps that were intact prior to excavation at TP-01 and TP-05. The clay sumps at TP-01 and TP-05 were found to contain sludge and sediment contaminated with non-hazardous waste concentrations of non-chlorinated organic solvents. Release of this contamination to the environment was not indicated. Lu Engineers removed and properly disposed of one drum of non-hazardous, solvent-contaminated sludge as an IRM during this process.

A sample was collected ("Pipe Contents TP-29") from sludge inside a cast iron pipe encountered at 1 ft. below grade in TP-29 on the western edge of the Site (see Figure 5). The contents of a clay sewer pipe were also screened and sampled at TP-35 in the former "low-rise" footprint ("Pipe Contents TP-35", Figure 5). Samples collected from soils surrounding the drainage features at TP-01, TP-05, TP-29, and TP-35 did not exhibit evidence of contamination (see Tables 1-1 and 1-2).

These findings warranted no additional investigation since impacts to soil and groundwater were not indicated. Impacts appeared to be limited to the interior of the subject piping. Little information was obtained regarding the overall layout of sewer piping or related features during this process. Additional

information regarding efforts to characterize and map the drainage features at the Site is presented in Section 2.3.6 and 2.3.7.

### **2.3.6 AOC-6: Underground Tunnels and Buried Utility Evaluation**

Throughout the SI, various efforts were made to identify the location and potential significance of the various underground utilities and tunnel locations on and adjacent to the Site. These efforts have included the following:

- Detailed review of available record mapping
- Targeted installation of test pits during RI work in 2008 and 2011
- Internal inspection of the large east/west tunnel (a.k.a., Main Tunnel) bisecting the western portion of the Site in 2011 (concurrent with the UST IRM)
- Inspection of the tunnel leading from Turner Bellows, Incorporated connecting underground to the southwestern Site perimeter
- Mobilization of Jamko, Incorporated to the Site in 2011 to access sewer and televise/map the system to the extent possible
- Ground penetrating radar scanning of building slabs in various locations in 2011.
- Boroscopic inspection of the Main Tunnel in the center of the 354 Whitney parcel
- Mapping of various sewer and utility access points throughout the property
- Thermal imaging photography in completed in 2013

Photographs of selected portions of the inspection process are included in Appendix I.

As part of this effort, a subcontracted utility scanning company, Jamko, Incorporated, was contracted by Lu Engineers to attempt to televise accessible portions of the remaining drainage features and tunnels.

With the exception of the Main Tunnel, little information was gained by this process due to the limited access to smaller diameter utilities as a result of damage apparently sustained during the multiple demolition efforts on the property since 2005. Unknown conditions within and around the Main Tunnel and smaller tunnels branching off to the north and south were identified as a data gap after completion of the 2008 SI.

The Main Tunnel was also physically entered to determine whether hazardous materials were present and to verify that its steel reinforced concrete roof could bear the load of trucks and other equipment to be mobilized for remediation of the adjacent AOC-2. A confined space entry plan was developed and air

monitoring was conducted continuously during the tunnel inspection. Lu Engineers determined that the roof of the tunnel was capable of bearing the weight of all proposed activities above. Inspection of the tunnel also revealed the presence of friable asbestos pipe covering on abandoned utility lines and approximately 5 feet of standing water. Previous sampling for TCL VOCs and SVOCs, PCBs and TAL Metals by NYSDEC in 2005, and additional assessment in 2006 by Lu Engineers, determined the water to contain low levels of target analytes.

The tunnel floor and walls are concrete and the tunnel is approximately 12 feet deep. Other branches of the tunnel system could not be accessed within the Site and are assumed to be associated with utilities which would have served manufacturing operations in the past. A portion of a closed tunnel was accessed from a commercial property (Turner Bellows, Inc.) to the west of the Site. However this tunnel terminates at the Site’s western perimeter and no additional information regarding the tunnel conditions was obtained.

**2.3.7 AOC-7: Former “Low-Rise” Sub-Slab Investigation**

Asbestos abatement and demolition of the 415 Orchard Street “Low Rise” in late 2009 allowed access to the building’s former footprint for sub-slab investigation.

On March 17, 2011 additional test pits were excavated by TREC as part of the evaluation of subsurface conditions in the area of the Orchard Street “Low Rise”. A total of eight (8) test pits were excavated beneath the concrete slab, as listed in the following table.

**AOC-7 Test Pits**

Test Pit	Depth of Sample Collected	PID Reading
TP-30	11.5 ft bgs	0 ppm
TP-31	9 ft bgs	30 ppm
TP-32	0-6 ft bgs and 10-11 ft bgs	0 ppm
TP-33	9.5-10.5 ft bgs	0 ppm
TP-34	No sample collected	0 ppm
TP-35	6 ft bgs and 10-11 ft bgs	0 ppm
TP-36	No sample collected	0 ppm
TP-37	10-10.5- ft bgs	0 ppm

Test pit soil samples were submitted for analysis of TCL VOCs, SVOCs, RCRA Metals, and PCBs. Analytical results are summarized in Section 4.0 and in the attached Tables 1-1 and 1-2.

To evaluate groundwater conditions in the AOC-7 portion of the Site, an additional monitoring well (MW-23) was installed in the center of the former low-rise area (Figure 5).

Soil and groundwater conditions within the 415 Orchard “Low Rise” footprint were found to be consistent with background levels of VOCs, SVOCs and metals elsewhere on the Site and no additional IRMs were proposed.

**2.3.8 AOC-8: Former Coal Storage**

The southern perimeter of the Site is defined by a railroad alignment reportedly used to supply equipment and materials to former Site manufacturing operations. This past activity has been confirmed by review of past investigations and historical aerial photographs.

Coal was used as a fuel for the boiler system that was the Site power plant. Coal was offloaded from rail cars and stored in “coal pockets” reportedly located along the southern Site perimeter, defined as AOC-8 (see Figure 3). Portions of the eastern extent of this area were partially evaluated (SB-07) in the 2008 SI work. However, the extent and environmental condition of the former coal storage area (AOC-8) was not fully assessed at that time. It is noted that construction/demolition (C/D) debris consisting primarily of brick and masonry is stored throughout the central and western portion of AOC-8.

A total of ten (10) additional test pits were installed to determine the vertical extent of the berm material staged on the southern perimeter of the Site and to determine whether residual coal, ash or other materials were present beneath the berm. The following table includes the general results of the test pit installations in this area of the Site.

**AOC-8 Test Pits**

Test Pit	Depth of Sample Collected	PID Reading
TP-19	12-15 ft bgs	0 ppm
TP-20	No sample collected	0 ppm
TP-21	10-12 ft bgs	0 ppm
TP-22	10 ft bgs	0 ppm
TP-23	No sample collected	0 ppm
TP-24	13.5-14.5 ft bgs	0 ppm
TP-25	8 ft bgs and 18-20 ft bgs	0 ppm
TP-26	14-15 ft bgs	5-6 ppm
TP-27	No sample collected	0 ppm
TP-28	8 ft bgs	0 ppm

Test pit soil samples were submitted for analysis of TCL VOCs, SVOCs, RCRA Metals, and PCBs. Analytical results are summarized in Section 4.0 and in the attached Tables 1-1 and 1-2.

In July 2011, MW-24 and MW-25 were installed on the top of the berm on the southern portion of the Site (Figure 5). Soil borings SB-26A and SB-26B were also

installed on top of the berm, between MW-24 and MW-25. MW-24 and MW-25 were completed with stick-up style protective casings. Well/soil boring logs and well construction details are provided in Appendix D.

### **2.3.9 Additional Groundwater Sampling**

A complete round of sampling was conducted in September 2011 prior to the AOC-1, AOC-2, and AOC-3 IRMs. A final round of sampling was conducted in December 2012, after completion of the IRMs. The results of all groundwater sampling events are summarized in Tables 3 and 3-1 and described in detail in Section 4.2. Groundwater sampling logs are provided in Appendix F.

## **2.4 Site Survey**

A Lu Engineers' NYS Licensed Surveyor conducted a Site survey to identify property boundaries, existing site features, structures, and monitoring wells. This information was used to create a base map of the Site using the NAD 83 UTM Zone 18 (NYTM) coordinate system to present these features and the locations of sample points.

The Site survey, completed on October 8, 2008 subsequent to the Whitney Street parcel structure demolition and installation of the groundwater monitoring wells, included the locations and elevations of installed groundwater monitoring wells, and all property boundaries, topographic features, landmarks and known utility corridors and tunnels. All other data collection points, including test pits, and surface sample locations were located using a hand held Global Positioning System (GPS) unit and plotted on the survey map using NAD 1983 State Plane New York West coordinates.

Monitoring well locations were surveyed and the top of casing determined to 0.010 foot accuracy to mean sea level by Lu Engineers' survey department. Groundwater depths, laboratory analytical data, Site survey data and GPS data was used to prepare groundwater flow models, depth to groundwater and local hydraulic gradient diagrams as well as to prepare contaminant concentration plume maps.

As the RI and IRM continued, new wells, sample points and other features were re-surveyed to allow mapping using GPS and other methods. In 2013, all environmental mapping for this project was converted to a GIS to facilitate access to all project data and locational information. The mapping included herein was produced using ERSI ArcGIS 2013.

With the City's planned subdivision of the property occupied by the 415 Orchard "High Rise" from the surrounding parcels, Lu Engineers re-surveyed the Site and assisted the City with the subdivision process. Underberg & Kessler, LLP were contracted through Lu Engineers to assist with this process. The latest update to the "Re-Subdivision Map"

containing the features required by the NYSDEC under DER-10 was completed on June 26, 2013 and is included as Appendix A.

## **2.5 Field Activity Documentation**

Field activities conducted by Lu Engineers were documented in Site-specific logbooks, included in Appendix J. Photographic documentation of project field activities is provided on a photo log in Appendix I. Soil boring logs were completed or reviewed by a qualified Lu Engineers geologist for each well boring and bedrock well and are included in Appendix D. Monitoring well construction is depicted on details, also included in Appendix D.

All data obtained during well development and sampling is provided on log sheets in Appendix F.

Health and safety monitoring of the work area was conducted throughout the duration of intrusive activities and demolition by Lu Engineers to assure the safety of on-Site workers. Air monitoring of the work areas was conducted using a PID equipped with a 10.2 eV lamp. PID readings are included in the field notes (Appendix J).

### **2.5.1 Community Air Monitoring**

Community air monitoring for VOCs and particulates was conducted at the upwind and downwind locations at the work area and site perimeters during all ground intrusive activities since the 2008 demolition of 354 Whitney Street. VOCs and particulates were detected at levels below established actions levels set forth in the CAMP and therefore vapor and dust suppression was not required during the soil removal IRM. All electronically logged air monitoring data is presented in the electronic version of this report, as Appendix K.

### **2.5.2 Quality Assurance/Quality Control**

Lu Engineers' Project Manager/Quality Assurance Officer for this project was Gregory L. Andrus. Eric Detweiler was the Field Team Leader for the project.

Samples collected by Lu Engineers were obtained, handled and characterized in accordance with NYSDEC ASP methods. Samples were immediately labeled and placed on ice, if necessary, in coolers for shipment to the laboratory. A portion of the waste characterization samples were relinquished to Test America Laboratory, an accredited and appropriately certified (NYSDEC ELAP CLP) analytical laboratory. Chain of custody requirements were strictly adhered to for designated analyses. After the initial RI efforts in 2008 and 2009, Paradigm Environmental Services, Inc. (NYSDOH ELAP # 10958) was used for all laboratory analytical work on this project. Laboratory analytical reports are included in the electronic version of this report, as Appendix L.

The NYSDEC Division of Environmental Remediation *Guidance for the Development of Quality Assurance Plans and Data Usability Summary Reports (DUSR)* was followed. DUSRs were prepared by Ms. Nancy Potak, an appropriately qualified data validator, and are included in the electronic version of this report as Appendix M. One matrix spike/matrix spike duplicate (MS/MSD) sample was collected for the sediment/surface soil samples, as well as for each round of groundwater samples. One trip blank was relinquished to the contract laboratory for the designated analyses; therefore, a total of 77 soil samples and 99 groundwater samples were obtained and analyzed during Lu Engineers' portion of the investigation.

Category B deliverables were provided for all analytical reporting with exception of waste characterization samples. Category B deliverables were used to provide a means of evaluating the usability of the analytical data. This data package also includes instrument calibration and related data required to verify reported results.

### **3.0 Physical Characteristics of the Study Area**

This section provides information on subsurface conditions and physical characteristics of the Site.

#### **3.1 Surface Features**

The Orchard Whitney Site is a 3.9-acre parcel formerly occupied by three structures (354 Whitney Street, 415 Orchard Street “Low-Rise”, and 415 Orchard Street “High Rise”). Two structures (354 Whitney Street and 415 Orchard Street “Low Rise”) were demolished as IRMs during this investigation. Where building slabs or pavement are no longer present, the Site is covered with sand/gravel fill (see Figure 6).

The topography is gently sloping from the southwest to the northeast. The topographic relief of the Site is 525 ft above mean sea level. The Site is relatively flat with the exception of the property to the immediate south being a raised railroad bed, approximately 5-8 ft above ground surface. Other features of note are the former Erie Canal and the Genesee River Gorge located approximately 4,400 ft to the east.

#### **3.2 Surface Water Hydrology**

Surface water runoff at the Site is collected in the combined Monroe County Sewer System. There are no surface water bodies within ½- mile radius of the Site. There are no public/private drinking water supply wells within ½- mile of the Site.

Utilities run the length of Orchard and Whitney Streets; both of these include municipal sanitary and water utilities. Electric service is aboveground along Orchard and Whitney Streets.

Floor drains presumably discharge to the municipal sewer system, located along Orchard and Whitney Streets.

Runoff from paved areas flow to private stormwater catch basins located in the eastern central portion of the Whitney Street Parcel as well as the northeastern and northwestern portions. Two municipal stormwater catch basins are located along Orchard Street and one municipal catch basin is located along Whitney Street.

#### **3.3 Geology**

According to the New York State Museum Map of New York, Finger Lakes Sheet, native soils beneath the Site consist mainly of lacustrine sands and silts; soils are underlain by Upper Silurian dolostones of the Lockport Group. During the SI, bedrock depths were found to vary from a minimum depth of approximately 7 feet to a maximum depth of greater than 38 feet below grade. A bedrock surface map is included as Figure 9.

Rock cores obtained during the project generally characterized the bedrock as hard, slightly weathered, massively bedded dolostone with few water-bearing fractures. Rock quality designations obtained from cores were generally found to be between 50 and 75%. Based on the characteristics of the bedrock at the Site, it is concluded that groundwater flow is through the saturated overburden and the bedrock/overburden interface.

During the intrusive work completed as part of this SI, very little weathered bedrock was observed, but the majority of bedrock fractures appeared to be within 2 to 3 feet of the bedrock surface. Higher permeability overburden was also observed in direct contact with the bedrock surface. The bedrock/overburden interface appears to represent a zone of higher permeability with the potential to increase contaminant mobility.

### **3.4 Soils**

According to the United States Department of Agriculture National Resource Conservation Service Soil Map of Monroe County, soil types mapped for the Site consist of Urban Land. Urban Land consist of areas that have been so altered or obscured by urban works and structures that identification of the soils is not feasible. This soil type is typical of highly developed areas of the City of Rochester.

Based on soil classifications of the test pits and soil borings completed by Lu Engineers at the Site, observed soil conditions consist mainly of silt and sand underlain by widely varying thicknesses of glacial till and/or coarser grained materials resting on the bedrock surface. However, sample recovery of materials in direct contact with the bedrock surface was generally poor. Large amounts of fill materials including brick, ash, concrete and crushed stone are also present throughout the Site in widely ranging thicknesses. Soil boring logs are included in Appendix D.

A review of soil stratigraphy was completed as part of the SI using subsurface data obtained during drilling and test pit excavations. The purpose of this review analysis was to develop a conceptual depiction of subsurface geologic and hydrogeologic conditions to allow a more complete understanding of contaminant occurrence, fate and transport. As part of this process, geologic cross sections were completed to illustrate generalized subsurface conditions. Cross Section A-A' indicates subsurface conditions from southwest to northeast (MW-09 to MW-08). Cross Section B-B' depicts subsurface conditions from northwest to southeast (MW-03 to MW-25). The soil cross sections are depicted on Figures 10.1 and 10.2.

### **3.5 Hydrogeology**

This section describes the groundwater flow patterns and hydraulic conductivity data for the Site. The description generated is based on groundwater elevation data obtained

during the SI and hydraulic conductivity data from slug tests completed in MW-9, MW-10, MW-11, MW-20 and MW-22 by Lu Engineers in March 2009.

Overburden groundwater flow patterns at the Site were generated using groundwater level measurements from the on-Site wells. Figure 7 is the groundwater contour map generated using measurements collected in December 2012. Groundwater flow direction is oriented perpendicular to the projected groundwater contour lines and trends down-gradient. Groundwater elevations are highest on the southwestern portion of the property and lowest along the northeastern portion, resulting in a general northeastward groundwater flow direction. Groundwater elevations decrease by up to 9 ft north-eastward across the Site. This is consistent with findings of the September 2005 EPA Targeted Site Assessment Project, and local topography (i.e., Barge Canal and Genesee River Gorge northeast of the Site).

Rising head slug tests were used to calculate hydraulic conductivity and groundwater velocities. The presence of unsaturated screened intervals in each site well precluded the use of falling head slug tests. Hydraulic conductivity (the relative mobility of groundwater through soils) data was obtained using the Bouwer and Rice Method (1976). Through the analysis of each rising head slug test, an average hydraulic conductivity for the Site was determined to be approximately  $1.47 \times 10^{-5}$  ft/sec (see Appendix G).

Groundwater velocity, the rate at which a groundwater aquifer flows through soil and/or bedrock, was calculated across two areas of the Site. The first groundwater velocity determination was calculated between MW-9 and MW-19, using the average K value for the site ( $1.47 \times 10^{-5}$ ). The slope across this portion of the site is gradual, with approximately seven (7) vertical feet for both the ground and groundwater surface over a horizontal distance of approximately 485 feet (1.5% +/-). The velocity on this portion of the Site was calculated to be approximately  $8.82 \times 10^{-7}$  ft/sec (0.076 ft/day).

The second groundwater velocity determination was made between wells MW-9 and MW-22, both of which were slug tested. The slope in this area is relatively gradual with relief of approximately 10 vertical ft over a horizontal distance of approximately 538 ft (5% +/-). The velocity on this portion of the Site was calculated to be approximately  $1.46 \times 10^{-6}$  ft/sec (0.126 ft/day) and is considered a maximum velocity for the Site.

Hydraulic conductivity and groundwater level data collected during the SI have indicated the following:

- Overburden material underlying the Site consists of a combination of sand, silt, and gravel (fill material) overlying a glacial till (silt, sand and gravel).
- Bedrock at the Site is located at an average depth of 14 ft bgs.
- Hydraulic conductivity measurements for on-Site wells (MW-9, MW-10, MW-14, MW-20 & MW-22) averaged  $1.47 \times 10^{-5}$  ft/min.

- The approximate maximum groundwater flow velocity has been calculated to be  $1.46 \times 10^{-6}$  ft/sec (0.126 ft/day).
- Depth to groundwater in the uppermost water bearing zone ranged between 5.5 and 10 ft bgs site-wide during the most recent sampling event in December 2012 (maximum of approximately 22 ft bgs at MW-25 on raised berm).
- Overall groundwater flow in the uppermost water bearing zone at the Site is generally from the southwest to the northeast.

Slug test data, hydraulic conductivity calculations, and groundwater velocity calculations are provided in Appendix G.

### **3.6 Demography, Land Use, and Water Use**

The area surrounding the Site is mainly residential and commercial; some light industrial is also present, as well as a railroad bed to the immediate south. Edgerton Park is located to the north of the Site, and Sahlen Stadium is located to the southeast.

Facilities serving children in the vicinity of the Site include: Rochester City Schools Elementary Level #5, 17, 30, 57, and Jefferson Secondary School. Facilities also serving the needs of elderly persons include: Jefferson High School and Edgerton Community Center.

### **3.7 Ecology**

Little to no vegetation is present on the Site due to the presence of cover materials including: concrete, asphalt, former building foundations, and demolition debris. No significant wildlife habitat exists on the site, except for the potential nesting and resting sites on building roofs and wires. Some nesting habitat and cover for avian species may be provided by vegetation on Site. No endangered species were identified at the Site. The Fish and Wildlife Resources Impact Analysis Decision Key was completed for the Site as part of DER-10. Based on the findings of our investigation, it was determined that there is no off-site contamination emanating from the property and a Fish and Wildlife Resources Impact Analysis is not needed.

The Fish and Wildlife Resources Impact Analysis Decision Key is included in Appendix N.

## 4.0 Nature and Extent of Contamination

In this section, laboratory analytical results are compared to the appropriate published SCGs values as indicated below. Analytical results are summarized in Tables 1, 2 and 3. Soil and groundwater data presented and discussed in this section represent the most current data available relative to the Site. Descriptions of the detailed investigation findings associated with the IRMs conducted relative to AOCs-1, 2 and 3 are also included for reference, but clearly differentiated from the discussions relating to current conditions. Additional discussion relative to the nature and extent of contamination is provided in Section 5, Contaminant Fate and Transport.

The location of the wells and test pits installed as part of the Site-wide evaluations of soil and groundwater conditions (and surface soils off-Site) were selected to represent an unbiased view of the surface and subsurface conditions present. Detailed investigations conducted with respect to AOCs-1, 2 and 3 were intended to be biased toward representing worst-case conditions within each target area as indicated by previous investigations or the Site-wide findings as the SI was in progress. All sample and test locations were approved by the City and/or the NYSDEC.

Exceedances of applicable groundwater standards are indicated on Figure 7. Figures 11.1 and 11.2 indicate exceedances in surface and subsurface soils. Data discussed in Section 4 references the sample numbering scheme used in the data tabulations provided in Table 1 through 4. Data collected during the detailed investigations of AOCs 1, 2 and 3 are included in the FER, which is provided as Appendix H. IRM related efforts and confirmatory sampling results are also summarized in this section of the SI.

### 4.1 Soil Samples

Analytical results are compared to the NYSDEC Soil Cleanup Objectives (SCOs) in 6 NYCRR Part 375-6.8(a) and (b) (effective December 14, 2006). Restricted Commercial Use is most applicable to future use of the Site, based on surrounding land uses and zoning districts. Commercial Use, as defined by the regulation at 6NYCRR Part 375-1.8 (g)(iii), is "...the land use category which shall only be considered for the primary purpose of buying, selling or trading of merchandise or services. Commercial use includes passive recreational uses, which are public uses with limited potential for soil contact".

The location of each surface and subsurface soil sample obtained during this investigation relative to current Site conditions is indicated on Figure 5.

#### 4.1.1 Subsurface Soil Regulatory Exceedances

A total of 73 subsurface soil samples were obtained and analyzed during the course of this RI. Twenty-six (26) samples were obtained during detailed investigations of portions of the Site being addressed by IRMs (AOC-01 and AOC-02, in particular). For purposes of this discussion, samples obtained during the detailed investigations followed by IRMs are omitted here as the associated analytical is not representative of current Site conditions. Additional information relative to the detailed investigations associated with IRMs are presented in the FER.

Unless otherwise noted, all subsurface soil samples were obtained from the vadose zone at depths varying from 6 to 8 feet below grade in each location. The following subsections indicate the subsurface soil samples representative of current Site conditions with exceedances of applicable soil use criteria.

##### Volatile Organics

There are no exceedances of Commercial Use Criteria with respect to VOCs in subsurface soils at the Site.

##### Semi-volatile Organics

Commercial Use Criteria were exceeded for the following SVOCs:

- Benzo(a)anthracene at OW-S-TP-18, OW-TP-19/25, and OW-Berm-1
- Benzo(a)pyrene at OW-S-SB-07, OW-S-TP-18, OW-TP-19/25, OW-TP-35 (Pipe Contents) and OW-Berm-1
- Benzo(b)fluoranthene at OW-S-TP-18, OW-TP-19/25, OW-TP-35 (Pipe Contents) and OW-Berm-1
- Dibenzo(a,h)anthracene at OW-S-TP-18, OW-TP-19/25 and OW-Berm-1
- Indeno(1,2,3-cd)pyrene at OW-S-TP-18

The location of TPs - 18, 19 and 25 and "Berm-01" within the southern portion of the berm indicates that the construction/demolition debris in these locations exceeds Commercial Use Criteria, but does not suggest that native soils beneath the berm material have been impacted. The fact that these sample locations represent all of the berm materials submitted for laboratory analysis from the southern area of the berm suggests that these exceedances may be widespread within the berm material pile at the southern perimeter of the Site. However, TP-28 and 29, obtained from the western berm pile located along Whitney Street did not yield elevated analytical results for SVOCs.

The elevated levels of SVOCs observed in sample TP-35 -Pipe Contents contrasts with the lack of SVOCs in the sample taken from the underlying soils (OW-TP-35/37) and suggests that the small amount of material contained with the piping

observed in this location has not resulted in a release of SVOCs to surrounding soils.

### Metals

Exceedances of Commercial Reuse Criteria were identified in subsurface soils including the following:

- Arsenic at OW-PA-SWC-4 and OW-PA-FC2/2B
- Barium at OW-TP-32, OW-TP-35 Pipe Contents, OW-TP-38 and TP-38 (OW-Berm-1)
- Cadmium at OW-TP-35 Pipe Contents, OW-PA-FC2/2B, OW-PA-SWC-4, OS-PA-SWC-6 and OW-PA-SWC-5
- Chromium at OW-S-SB-19, OW-PA-SWC-7 and OW-PA-SWC-7B

The occurrence of arsenic, cadmium and chromium within the former plating area is known to be related to the former industrial operations in this portion of the Site. Although the IRM completed in this area addressed the presence of hazardous waste level exceedances, residual contaminant levels remain above the Commercial Use Criteria throughout this portion of the Site. It is noted that AOC-2 is largely hydraulically isolated from the surrounding area by the presence of subsurface concrete walls extending through the saturated zone.

It is also noted that chromium concentrations found in surface soils throughout the Site exceed both the Protection of Groundwater and Residential standards defined in 6NYCRR part 375. The source of this Site-wide level of elevated level of chromium is not known, but is also found at both up (SB-05, MW-09, MW-10) and down (MW-08) gradient locations relative to the Site. These findings represent typical concentrations found in urban soils observed elsewhere within the City of Rochester.

As detailed in the FER (Appendix H), soils within the former plating area were almost entirely removed and replaced with clean fill to an average depth of 10 feet below grade. The presence of residual RCRA metals-contaminated soils in this area of the Site at depth represents a substantial improvement over Site conditions prior to implementation of the AOC-2 IRM, which included removal of the contaminant source area. This IRM, in conjunction with imposing institutional and/or engineering controls, may mitigate the need for any further remedial action in the future. The occurrence of elevated levels of RCRA metals elsewhere do not appear to be associated with a source area or an identifiable contaminant release.

The presence of elevated levels of Barium at OW-TP-32, OW-TP-35-Pipe Contents, OW-TP-38 and TP-38 (OW-Berm-1) may be related to the past painting and various other industrial operations that took place on the Site throughout its

long history. No point source of barium contamination has been identified and the random occurrence of this metal does not suggest one.

#### Pre-IRM Metals Contaminant Concentrations in AOC-2 Source Area

Soil samples collected during the detailed investigation of AOC-02 were analyzed for RCRA metals by EPA Method SW 846: 3050/6010, 7471 and revealed concentrations of the metals arsenic, cadmium and Cr<sup>+6</sup> at concentrations exceeding NYSDEC 6 NYCRR Part 375 Commercial and Industrial Soil Cleanup Objectives (SCOs).

Chromium concentrations were found to be elevated throughout this portion of the Site. Analytical results of each sample collected indicated that all samples exceeded Unrestricted Use SCOs. Boring samples PA-10 (7-8') and PA-14 (10.5-12') revealed the highest chromium concentrations and were the only samples to exceed Commercial Use SCOs. Only one sample, PA-09 (4-6') exceeded applicable SCOs for arsenic.

Three (3) samples exceeded applicable SCOs for cadmium. Samples from borings PA-12 and PA-16 exceeded the Commercial SCO at concentrations of 12.3 mg/kg and 23.8 mg/kg, respectively. The PA-12 sample was collected from 0.5-2.0 feet below the former concrete plating area slab where discolored soils were observed. The PA-16 sample was collected from a depth of 10.5-12 feet below grade, immediately below the UST 1-5 vault floor. Boring sample PA-08 was collected from a depth of 8.5-9.5 feet below grade and exceeded the Industrial SCO for cadmium at a concentration of 60.3 mg/kg.

It is noted that the data obtained during the detailed investigation of AOC-02 does not represent current Site conditions since the IRM removed the majority of this material for proper disposal off-Site.

#### PCBs

No exceedances of Commercial Use Criteria have been identified with respect to PCBs.

#### **4.1.2 Background Surface Soil Regulatory Exceedances**

No surface soils were accessible for sampling on-Site since the entire surface is covered by concrete, asphalt, building foundations, and/or demolition debris piles (see Figure 6). Four (4) surface soil samples were obtained from off-Site locations as indicated on Figure 5. Regulatory exceedances found in surface soils are identified below and indicated on Table 2.

### Semi-Volatile Organics

The following exceedances of Commercial Reuse Criteria were identified in off-Site surface soils relative to SVOCs:

- Benzo(a)anthracene at OW-S-SS-04
- Benzo(a)pyrene at OW-S-SS-01, OW-S-SS-02, OW-S-SS-03, and OW-S-SS-04
- Benzo(b)fluoranthene at OW-S-SS-04
- Dibenzo(a,h)anthracene at OW-S-SS-03

These contaminants are common in urban environments and no source area is suggested by the presence of SVOCs adjacent to the Site.

### Metals

The following exceedances of Commercial Reuse Criteria were identified in off-Site surface soils relative to metals:

- Barium at OW-S-SS-03
- Cadmium at OW-S-SS-04

As is the case with the detected SVOCs, elevated levels of barium and cadmium are common in urban environments and no source area is suggested by the presence of SVOCs adjacent to the Site.

### PCBs

No exceedances of Commercial Reuse Criteria were identified with respect to PCBs in off-Site surface soils

## **4.2 Groundwater Samples**

Analytical results are compared to the NYS Class GA Groundwater Quality Standards from 6 NYCRR Parts 700-705 (NYS, 1999b), as well as to guidance values in the NYSDEC Technical and Operational Guidance Series (TOGS) 1.1.1 (NYSDEC, 1998).

### **4.2.1 Groundwater Regulatory Exceedances**

The following is a synopsis of the current groundwater conditions at the Site based on the latest groundwater sampling event that was conducted in December 2012. These data are used as the most representative since prior sampling events were followed by IRMs that influenced the nature and extent of contamination on the Site. This most recent event does not include analysis for SVOCs and PCBs. Analysis for SVOCs and PCBs was discontinued as approved by NYSDEC due to the lack of exceedances observed in the initial groundwater sampling events. Previous Site-wide groundwater sampling events were completed in October 2008, March 2009 and September 2011.

Table 3-1 includes all Site-wide groundwater analytical data obtained during the course of this project. Sample locations and current regulatory exceedances are indicated on Figure 7.

#### Volatile Organics

The following VOCs were found to exceed applicable criteria as indicated:

- 2-Butanone at PA-14
- 1-4-Dioxane at PA-15D
- Acetone at PA-14
- Benzene at PA-14, PA-15D and PA-15S
- Chloroform at MW-21 and PA-03
- Toluene exceeds at PA-14
- Trichloroethene at MW-17 and PA-15S
- Vinyl Chloride at MW-15D

The presence of benzene and toluene within the former plating area is assumed to be related to past petroleum releases from the former USTs removed during the AOC-01 IRM. A total of nine (9) USTs containing 14,250 gallons of petroleum and solvents, as well as all accessible (248 tons) hazardous and non-hazardous petroleum-contaminated soil were removed from this area of the Site. However, inaccessible areas of the property including the adjacent footprint of the 415 Orchard Street "High Rise" may contain contaminated media that will continue to release low levels of petroleum VOCs over time.

2-Butanone and acetone are common chemicals in the environment, which can occur as a result of natural degradation of organic materials or as a result of past industrial operations. No source for these VOCs is suggested by their occurrence on the Site. The compounds were not detected at elevated levels in Site subsurface soils.

The elevated level of 1-4 dioxane is an outlier as no occurrence of this VOC has been detected in previous analytical data or elsewhere on the Site in the latest (December 2012) analytical report. Likewise, the presence of chloroform, a common laboratory artifact, does not indicate the location of a source on the Site.

Trichloroethene (TCE) was detected at relatively low levels at MW-17 (< 10 ppb) and at other locations during the course of the RI including MWs-06, 07, 18, 19 and 19D. The level of TCE at MW-17 and PA-15S is relatively low (5.25 ppb and 7.4 ppb, respectively) and the widespread presence of this chemical on the Site over the duration of the SI does not indicate a single point source. It is also noted that the presence of this chemical in groundwater is common in former

industrial sites. It is suggested that the presence of vinyl chloride at PA-15D is related to natural attenuation of TCE detected at PA-15S.

### Metals

Metals concentrations exceeded groundwater standards as follows:

- Arsenic at MW-11 and MW-14
- Cadmium at MW-16 and MW-21
- Chromium at MW-14, MW-17, PA-04 and PA-14
- Hexavalent Chromium at MW-17 and PA-04
- Lead at MW-07, MW-11 and MW-14
- Selenium at MW-11

The presence of elevated hexavalent chromium in groundwater at the former plating area (MW-17, PA-04 and PA-14) represents residual levels of this element since the AOC-2 IRM was completed in 2012. It can be concluded that the former plating operations at the Site may have also contributed to the presence of arsenic and chromium at MW-14, however no link between these two locations has been established at the present time.

AOC-2 appears to be hydraulically isolated from surrounding areas due to the presence of subsurface barriers including concrete walls and footers of former buildings, the tunnel system, and the former UST vaults.

Lead levels observed in MW-07, MW-11 and MW-14 in the December 2012 analytical round represents the first time this metal was detected at elevated concentrations in groundwater at the Site. The presence of lead may be attributed to long term industrial use of the Site and surrounding areas. Likewise, the presence of elevated levels of selenium at MW-11, also a common contaminant in former industrial sites does not appear to suggest a discrete source area for this contaminant.

### Pre-IRM Metals Contaminant Concentrations in AOC-2 Source Area

AOC-2 Groundwater sample results were compared to the NYSDEC Part 703.5 Class GA and NYS TOGS 1.1.1 water quality standards. Analytical results of samples collected from PA-10S (shallow well in nested pair) and PA-12 exceeded the applicable regulatory standard for cadmium. Samples from micro-wells PA-04, PA-07, PA-08S, PA-09, PA-10S, PA-10D, PA-11, PA-14, PA-15S, and PA-15D also exceeded the regulatory standards for chromium.

It is noted that the data obtained during the detailed investigation of groundwater within AOC-02 does not represent current Site conditions since IRM excavations and in-situ molasses treatment mitigated the presence of these contaminants from this portion of the Site except as noted above.

SVOCs and PCBs

Concentrations of PCBs and SVOCs in groundwater were not observed to exceed applicable standards on the subject Site.

**4.3 Elemental Lead in Building Slabs**

Lead was commonly used to seal cracks and penetrations in floor slabs in industrial plants in the past. Lead has been observed in the remaining slabs at the Site in a number of locations. Attempts to quantify the amount of lead remaining in the slabs have been complicated by the presence of varying amounts of dust and debris at the surface. The presence of lead in the remaining slabs will be addressed in the SMP, as necessary.

## 5.0 Contaminant Fate and Transport

This Section includes an evaluation of contaminant fate and transport for the Site including identifying potential routes of migration, contaminant persistence, and contaminant migration.

### 5.1 Potential Routes of Migration

Potential routes of migration identified for the Site include:

- Petroleum-related VOCs migrating off-site in a dissolved groundwater plume;
- Organic and inorganic contaminants in sub-surface soils impacting the groundwater;
- Volatilization of VOCs in sub-surface soil and groundwater;
- If impacted soils or groundwater were to be disturbed, indirect migration pathways may include movement via construction equipment, evaporation, dust generation, spreading of contaminated groundwater to unaffected areas, etc.

### 5.2 Contaminant Persistence

Contamination at the Site is identified as consisting of petroleum-related VOCs in groundwater; SVOCs and metals in surface soil, sediments, and sub-slab soil; and metals in groundwater. Petroleum-related VOCs are degraded aerobically and anaerobically by microorganisms found naturally in the subsurface. SVOCs, metals, and pesticides are more persistent in the environment and would not be expected to degrade readily in the sub-surface. The chemical characteristics and fate of contaminants detected above applicable SCGs are summarized in the following table.

**Contaminant Persistence Table**

Chemical of Concern	Occurrence on Site <sup>1</sup>	Uses	Behavior in Water	Behavior in Air	Behavior in Soil
Acetone	Acetone exceeds groundwater standards at PA-14.	Intermediate compound in chemical manufacture (chloroform, bisphenol-A etc.), paint, varnish, solvent, clean and dry industrial equipment, sealants and adhesives, used in machine lubricating oils	chlorinated water may react with acetone to form chloroform (reaction proceeds readily at neutral and near neutral pH)	acetone vapor may break down into CO and free radicals (breakdown due to sunlight not direct interaction with air)	
Arsenic	Arsenic exceeds groundwater standards at MW-11 and MW-14.	Bronzing, used in lead alloys (strengthens lead components in car batteries), used in some semiconductor materials	Strongly sorbs to sediments. Does not volatilize. Some forms of arsenic are soluble and may travel with groundwater flow. Can dissolve in water and end up in soil and sediment	Adsorbs to airborne particulates. May be removed from air by rain and snow.	absorbed by plants, naturally occurring at low levels in the soil
Barium	Barium exceeds soil criteria for commercial reuse at OW-S-SS-03, OW-S-TP-18, OW-TP-32, and OW-Berm-1.	Metal alloy additive, spark plugs, Used by the oil and gas industries to make drilling muds. Also used to make paint, bricks, ceramics, glass and rubber.	Barium sulfate and barium carbonate, do not dissolve well in water. Barium chloride, barium nitrate, or barium hydroxide dissolve easily in water usually do not last in these forms for a long time in the environment.	low reactivity with oxygen, nitrogen and carbon dioxide	Not very mobile in most soil systems, may ionize and form various salts depending on the pH
Benzene	Benzene exceeds groundwater standards at PA-14, PA-15D and PA-15S.	Used in the production of insecticides, pesticides, fumigants, explosives, dyes, coatings, plastics, resins, solvents, rubber cement, gasoline, manufacture of many organics used in industrial processes (ethylbenzene, cyclohexane, diphenyls, chlorbenzenes)	Irradiation of aqueous solutions may form aldehydes, in anoxic conditions benzene has been known to degrade to phenol	benzene vapor can break down in sunlight and form ethylene, hydrogen, methane, ethane, toluene and cuprene, in the atmosphere benzene can react with hydroxyl or NOx gasses and form phenol or nitrobenzene	Microorganisms in soil react with benzene to form phenols and may degrade into other organic compounds and acids -in activated sludge some benzene can mineralize to CO2

Chemical of Concern	Occurrence on Site <sup>1</sup>	Uses	Behavior in Water	Behavior in Air	Behavior in Soil
2-Butanone	2-Butanone exceeds groundwater standards at PA-14.	solvent, vinyl films, resins, paints, paint removers, cements, adhesives, organic synthesis (2-butanol, butane, amines), cleaning fluids, acrylic coatings		in air containing nitrous acid exposed to sunlight 2-butanone can form nitrates	
Cadmium	Cadmium exceeds groundwater standards at MW-16 and MW-2. Cadmium exceeds Commercial Use SCO at OW-S-SS-04, OW-PA-FC2/2B, OS-PA-SWC-6 and OW-PA-SWC-5.	industrial process, battery production, pigmentation, coatings, electroplating, fertilizers	cadmium compounds sometimes ionize in water	in the air as a result of burning fossil fuels	can be absorbed into plants
Chloroform	Chloroform exceeds groundwater standards at MW-21 and PA-03.	fluorocarbon refrigerants and plastics, solvents, soil fumigant, insecticides, cleaning electronics	chloroform can react in solution for form CO <sub>2</sub>	broken down to phosgene, CO <sub>2</sub> , CO, hydrogen chloride and other chlorides	Does not sorb readily to soil and can easily travel through soil to groundwater where it dissolves easily and may breakdown to other chemicals and can last for extended periods.
Chromium and Hexavalent Chromium	Chromium exceeds groundwater standards at MW-14, MW-17, PA-04 and PA-14. Chromium exceeds soil criteria for commercial reuse at OW-S-SB-19 and OW-PA-SWC-7/7B.	steel production, chrome plating, dyes and pigments, leather tanning, and wood preserving, automobile refinishing, commonly found in abandoned industrial sites	commonly found in drinking water sources	Does not often remain in the atmosphere, but is deposited into the soil and water	commonly found in soils
1,4-Dioxane	1-4-Dioxane exceeds groundwater standards at PA-15D.	solvent, paint/varnish, removers, cements, fumigants, detergents, polishing	Easily dissolves in water	may react to form glyoxylic acid and oxygenated formates, monoformates, and diformates	
Lead	Lead exceeds groundwater standards at MW-07, MW-11	used in the production of batteries and metal products,	commonly found in waters as a result of burning fossil	Once released into the atmosphere, lead	Relatively immobile and can persist in soils

Chemical of Concern	Occurrence on Site <sup>1</sup>	Uses	Behavior in Water	Behavior in Air	Behavior in Soil
	and MW-14.	leaded fuels	fuels, mining, and manufacturing, in the environment lead is highly toxic to humans	particles disperse and may be removed by wet or dry deposition <sup>2</sup>	for long periods of time; usually accumulates in top soil after it has formed complexes with organic matter. Adsorption is based on the soils pH, type, size, organic matter, and other factors.
Polynuclear Aromatic Hydrocarbons (PAHs)	PAHs exceed Commercial Use SCO's at OW-S-SB-07, TP-18, TP-19/25, TP-35 pipe contents, and OW-Berm-1.	Occurs in fossil fuels and is released to the environment as a product of incomplete combustion.	Do not easily dissolve in water.	Vapors sorbed to small solid particles can travel long distances before they return to earth in rainfall or particle settling	Sorb tightly to particles. Biodegrades in presence of microorganisms
Toluene	Toluene exceeds groundwater standards at PA-14.	Used in the manufacture of other organic compounds, solvent, detergent in manufacturing , naturally occurring in gasoline	Will not readily adsorb to sediments or solid particles. Biodegrades in water with a half-life of 100-1,386 days.	Evaporates quickly into air from soil and water. Half-life in air is 3 days.	Relatively mobile in soil. Readily broken down by microorganisms in soil with a half-life of several hours to 71 days.
Trichloroethene	Trichloroethene exceeds groundwater standards at MW-17 and PA-15S.	Solvent, dry cleaning, degreaser for metal parts, refrigerants	CO <sub>2</sub> and CO produced under anaerobic conditions, can degrade into different tri and dichloroethene products	slowly decomposes	
Vinyl Chloride	Vinyl Chloride exceeds groundwater standards at MW-15D.	manufacture of polyvinyl chloride, adhesives, refrigerant, extraction solvent, organic synthesis	degradation can occur by biologic activity of microorganisms enhanced by high levels of nutrients ultimately forming methane and ethylene	irradiation can result in the formation of acids, ozone, CO and other organic compounds	

<sup>1</sup> Limited to analytical findings relative to environmental media only (soil, surface soil and groundwater)

### 5.3 Contaminant Migration

Contaminant migration patterns are further described in this section. Contaminants at the Site detected above regulatory criteria include: petroleum-related VOCs in groundwater; and SVOCs and metals in surface soil, sediments, and sub-slab soil.

The most predominant source of detected VOC contamination appears to be associated with former USTs and associated piping located adjacent to the western wall of the 415 Orchard Street "High Rise". During removal of these petroleum and solvent storage tanks, it was evident that tank contents had leaked into the surrounding bedding, into the concrete vaults, and beneath one un-lined tank grave. Past releases of petroleum have migrated downward through the soils and impacted groundwater. Groundwater impacts are most significant in the area of MW-17, and PA-14, 15D and 15S located west of the former USTs. Dissolved-phase VOCs, benzene in particular, has migrated westward from the former USTs.

The presence of the building to the immediate east of the former tank pit has prevented investigation of potential eastward migration. However, the fact that elevated VOCs have not been identified in MW-16, immediately down gradient of the former UST location to the northeast, may indicate that the VOCs in this area are not substantially mobile. Contaminant mobility may also be restricted by the presence of the deep concrete structures of the former tank pit vault, adjacent tunnel, and 415 Orchard Street "High Rise" building foundations which extend down through the saturated zone to a depth of up to 12 feet below grade. This is coincident with the observed depth to bedrock in this area of the Site. It is suggested that the presence of residual aqueous chromium in the plating area can be attributed to the hydraulic isolation of this location by the deep concrete barriers. However, the anomalous 38-foot depth to bedrock at the southeastern corner of the 415 Orchard Street "High Rise" ( PA-01), may allow eastward migration of contaminants into uninvestigated portions of the Site beneath the remaining structure.

During the December 2012 groundwater sampling event, elevated levels of lead were observed in groundwater at MW-7, MW-11 and MW-14. Elevated concentrations of arsenic were observed in groundwater sampled from MW-11 and MW-14. Selenium exceeded the NYSDEC groundwater standard at MW-11 and chromium was also found to exceed the applicable standard at MW-14. It is noted that during prior groundwater sampling events, none of these contaminant occurrences were observed. The fact that the occurrences are not in close proximity to known AOCs and no other on-Site point sources for these contaminants is known suggests that they may have migrated from an up-gradient source, or may be representative of background conditions.

Surface and subsurface soils contain levels of SVOCs and RCRA metals at levels exceeding Commercial Re-Use Criteria in a number of locations as described in Sections

4.1 and 4.3. Migration of these contaminants in soil is considered to be minimal in part because the majority of the Site remains covered by concrete slabs, weathered asphalt and/or large pile of demolition debris. The occurrence of SVOC and RCRA metals in off-Site surface soils is relatively consistent with the on-Site occurrence of subsurface contaminants with the exception of the former Plating Area. This would appear to suggest that these contaminants may represent background concentrations for this area of the City of Rochester. SVOCs and metals identified in Site soils have relatively low mobility in the subsurface and would not be expected to impact the underlying groundwater.

### **5.3.1 Factors Affecting Contaminant Migration**

Factors affecting contaminant migration include: advection; dispersion; molecular diffusion; adsorption of constituents onto soil particles; microbial and chemical degradation; and partitioning of constituents between soil, groundwater, and air. Contaminant migration within the Site is substantially influenced by the presence of the restrictive deep concrete structures located above and within the saturated zone where residual soil and groundwater contamination remains.

Groundwater contamination present at the Site generally consists of petroleum-related VOCs. These compounds are typically soluble in water and do not adsorb to sediments or solid particles, therefore, they are relatively mobile in the environment. Natural breakdown and dispersion of petroleum compounds in the subsurface limits the extent of contaminant migration. The metals detected in groundwater vary in their mobility, but are typically less mobile in groundwater than VOCs. Metals are not substantially affected by the presence of microbial degradation and attenuate primarily by means of dispersion and chemical reactions including oxidation.

Groundwater flow at the Site is toward the northeast, however, it does not appear that contamination has migrated off-site since only very low levels were detected in the down-gradient wells MW-8 and MW-22. Hydraulic conductivity measurements for on-Site wells (MW-9, MW-10, MW-14, MW-20 & MW-22) averaged  $1.47 \times 10^{-5}$  ft/min. The approximate maximum groundwater flow velocity has been calculated to be  $1.46 \times 10^{-6}$  ft/sec (0.126 ft/day).

## 6.0 Summary and Conclusions

### 6.1 Investigation Summary

This remedial investigation has been completed in stages since 2006. This period of time encompasses numerous tasks associated with both IRMs and investigation activities. Investigations performed as part of this project included:

- Detailed evaluation of past Site uses
- Evaluation of building materials for the presence of asbestos and/or other hazardous materials.
- Evaluation of surface soil conditions;
- Evaluation of subsurface soil conditions;
- Evaluation of groundwater conditions; and

IRMs completed during the RI included incidental removal and disposal of small quantities of wastes encountered during the investigation process including:

- Asbestos abatement
- Building demolition
- Transformer removal and disposal
- Incidental materials recovery and disposal

Additional IRMs were completed to mitigate environmental conditions associated with AOCs 1, 2 and 3. The following wastes were removed from the Site as part of AOC-related IRMs for proper disposal:

#### AOC-Related IRMs

IRM WASTE STREAMS	WASTE QUANTITY
<b><u>AOC-1:</u></b>	
UST Waste Products (Petroleum and Solvents)	14,245 gallons
Non-Hazardous Tank Bedding Materials	213.28 tons
Hazardous Tank Bedding Soil	14.6 tons
UST Cleaning Residues	1,110 gallons
<b><u>AOC-2</u></b>	
Non-Hazardous Soils (Including Chimney Ash)	533.65 tons
Hazardous Soils	127.05 tons
Decontamination and Purge Water	100 gallons
Frac Tank Cleaning Residues	55 gallons
Chimney Base Waste Water	555 gallons
<b><u>AOC-3</u></b>	
Petroleum-Contaminated Soils	5 tons

A total of 16 aqueous and 26 solid samples were obtained as part of completion of the targeted investigation of these AOCs. Analytical results for all RI sampling are included in Tables 1 through 3.

SI work at the Site included laboratory analysis of 176 samples including four (4) surface soils, 73 subsurface soils and 99 groundwater samples. Various building material samples were also submitted for laboratory analysis of asbestos, lead, and PCBs as described in the reports provided as Appendix B. Field screening with real-time instruments was used to supplement the laboratory data. Waste characterization samples were obtained as indicated in the FER (Appendix H).

The majority of the onsite structures have been demolished, which allowed access to the majority of the subject property. The remaining “High Rise” at 415 Orchard Street has not been completely evaluated with respect to potential subsurface contamination. The City is in the process of subdividing the footprint of this structure from the remaining portions of the Site to facilitate closure of the property under the NYSDEC ERP.

Off-site investigation to determine background conditions in the vicinity of the Site included the installation and sampling of four (4) wells, two (2) soil borings and four (4) surface soil sample points. All of the off-Site investigation activities took place within City-owned right-of-way on adjacent streets.

## **6.2 Conclusions**

Beginning in 2007, Lu Engineers conducted historical research followed by extensive surface and subsurface investigation of soil and groundwater media, as well as soil and groundwater remediation through three (3) IRMs at the subject Site. Environmental hazards related to and including the demolition of most Site structures were also addressed as IRMs during this period. The identified sources of contamination remaining at the Site include: VOCs and SVOCs associated with petroleum storage and other past industrial operations; and RCRA metal-contaminated soil and groundwater related to past metal finishing operations.

The highest levels of soil and groundwater contamination remaining is located to the west of the remaining 415 Orchard Street structure, as indicated on Figures 7, 11.1 and 11.2. Soil and groundwater in this area is impacted by low-level concentrations of solvents and non-hazardous concentrations of metals. SVOCs are present in soils west of the 415 Orchard Street “High Rise” as well as in the berm on the southern perimeter of the Site and within piping found at TP-35, within the former footprint of the 415 Orchard Street “Low Rise”. Lead was found to exceed groundwater standards in the northern (MW-7 and 14) and western (MW-11) portion of the Site.

Groundwater flow is generally to the northeast, toward the Genesee River. There is no evidence to suggest that contaminated soil or groundwater has migrated off-site.

Off-site surface soil sampling in the vicinity of the Site indicates that detected Site contaminants are present in the environment surrounding the subject property. Therefore, it is concluded that the occurrence of SVOC and metals contamination across the Site is at least partially related to the presence of these contaminants in the background Site environment.

Due to potential exposure hazards to human health and the environment, surface and likely subsurface soil and groundwater contamination will need to be addressed as part of the planning process associated with eventual re-use of the Site. If future Site redevelopment involves excavation or disturbance of impacted soils and/or contact with groundwater, there is a potential for human exposures and contaminant migration. Potential future exposures shall be addressed by the final Site remedy. Existing contaminant concentrations identified in groundwater are expected to decrease over time due to natural attenuation processes in the subsurface.

It is concluded that the relatively high permeability of Site soils and presence of various impermeable subsurface features have had a significant effect on the nature and extent of contamination on the Site. Based on the complexity and duration of past industrial operations at this Site, much higher levels of residual contamination could have reasonably been expected. Contaminant source areas including underground petroleum storage and hazardous waste levels of RCRA metals in soil and groundwater appear to have remained almost unaffected by long-term processes that would typically result in release of these contaminants to the surrounding environment. This fact facilitated completion of IRMs and prevented what may have otherwise been a much wider distribution of contamination at the Site and a substantial increase in the costs required for remediation.

In 2003, one of the largest arson fires ever to occur in the City of Rochester occurred on the subject Site when the multistory industrial buildings formerly occupying the western portion of the Whitney Street parcel burned. The City of Rochester Fire Department used several million gallons of water in fighting this fire, much of which would have entered the subsurface at that time. Likewise, at least two fires have occurred at the 415 Orchard Street "High Rise", which would have also resulting in the release of large amounts of water into the subsurface. It is inferred that the introduction of large amounts of clean water into the subsurface of the Site over the years, has helped to attenuate Site contaminants observed in soil and groundwater.

Results of off-site groundwater sampling do not indicate a concern with public exposure to impacted groundwater at this time.

#### **6.2.1 Data Limitations and Recommendations for Future Work**

Due to the large volume of confirmatory samples collected and with NYSDEC concurrence, Data Usability Summary Reports (DUSRs) were prepared for 25% of

the confirmatory samples collected at the Site. No significant analytical data limitations were identified during the data usability review. Data Usability Summary Reports (DUSRs) were prepared by Ms. Nancy Potak and are included as Appendix M. An email response provided by Paradigm, relating to certain minor issues mentioned in the DUSRs, is also included in Appendix M.

Based on investigation data generated, remedial actions conducted to date and the anticipated future use of the Site, Lu Engineers recommends the following:

- 1) No further action at the Site with respect to additional investigative or remedial efforts.
- 2) Cap the areas of the Site identified as being impacted with SVOC and metals contaminants in surface soils with an approved soil cover as necessary to facilitate future development plans.
- 3) Develop a Site Management Plan (SMP), including a Soil Management Plan, to establish the necessary protocols to: provide worker safety measures; and to properly address contaminants or previously unidentified subsurface features, such as tanks or piping, if future development involves the disturbance of contaminated surface and subsurface soils.
- 4) Impose engineering controls/institutional controls (ECs/ICs) to disallow the use of Site groundwater.

#### **6.2.2 Recommended Remedial Action Objectives**

Based on the findings of this investigation, the following Remedial Action Objectives (RAOs) are recommended:

- Prevent ingestion of groundwater with contaminant levels exceeding drinking water standards;
- Prevent ingestion and direct contact with petroleum-impacted subsurface soils;
- Prevent contact with, or inhalation of, VOCs from petroleum-impacted subsurface soil and groundwater at the Site; and
- Prevent migration of contamination that would result in impacts to surface water or groundwater.

An SMP will be required for this Site to be used as a guide for future use and potential development.

## **7.0 Exposure Assessment**

The purpose of this exposure assessment is to qualitatively evaluate the contaminants of concern and the affected media with respect to potential exposure pathways and human receptors. This assessment is done to evaluate the potential for exposure routes to be present in order to facilitate the development of a remedial action plan.

The following exposure pathways were evaluated:

- Ingestion of impacted soil and/or groundwater;
- Inhalation of vapors and/or dust; and
- Direct contact with impacted soil/groundwater.

Potential human receptors in the vicinity of the Site include:

- Residents living nearby;
- Visitors to the Site;
- City employees;
- Construction workers involved with remedial activities or Site redevelopment; and
- Construction workers involved with excavation in the City-owned rights-of-way adjacent to the Site.

### **7.1 Qualitative Public Exposure Assessment**

The following is an evaluation of the exposure pathways and their status with respect to the Site.

#### Ingestion of Contaminated Soil and/or Groundwater

Access to the Site is limited to authorized personnel the City of Rochester. The entrance is secured by a fence and locked gate. Ingestion of soils is therefore an unlikely exposure pathway.

There are currently no drinking water wells on the Site and a public water supply is available to the entire City of Rochester. Deed restrictions may be necessary to restrict future use of groundwater at the Site. No private drinking water wells are present in the area.

#### Inhalation of Vapors

The potential exists for volatilization of petroleum-related VOCs and SVOCs from impacted soil/ groundwater. Exposure to soil vapor could occur during excavation in impacted areas. Onsite workers could be exposed to VOCs and SVOCs during future development if excavation of impacted media (approximately 0-10 feet bgs) were to occur. Potential future exposures can be mitigated by means of a Site Management Plan.

Soil vapor intrusion is not a concern at the Site since there are no occupied structures. Adjoining occupied properties are located a sufficient distance away from the VOC source area that soil vapor intrusion exposures are not likely at the present time. However, soil vapor intrusion should be considered with respect to future Site development.

Direct Contact with Impacted Soils and/or Groundwater

Direct contact with impacted soil and/or groundwater on the Site is unlikely since it is securely fenced and unoccupied.

The potential exists for future exposures if workers come into contact with impacted media during excavation or Site development activities. All work should be performed in accordance with an approved Health and Safety Plan and knowledge of Site conditions. Future recreational use of the Site could present a risk for public exposure to impacted surface soils. Site controls, such as clean cover material, would mitigate this risk.

**7.2 Environmental Exposure Assessment**

The Fish and Wildlife Resources Impact Analysis (FWRIA) Decision Key was completed for the Site, as outlined in DER-10, and is included as Appendix F. Based on the Decision Key, it has been determined that a FWRIA is not required for this Site.

## 8.0 Identification and Development of Alternatives

This section identifies and develops remedial action objectives and alternative remedies to address contamination identified during the RI at the Site.

### 8.1 Remedial Action Objectives

Remedial action objectives (RAOs) are objectives for the protection of public health and the environment and are developed based on contaminant-specific standards and guidance to address contamination at the Site. Based on the RI findings, the following RAOs have been developed:

- Prevent contact with subsurface soil at the Site which has been impacted by metals and SVOCs
- Prevent contact with groundwater impacted by VOCs and metals
- Prevent migration of contamination that would result in impacts to surface water

#### 8.1.1 Contaminants of Concern

A contaminant of concern (COC) is a contaminant that is sufficiently present in frequency and concentration in the environment to require evaluation for remedial action. Not all contaminants identified on the property are considered contaminants of concern. The COCs identified at this Site are primarily petroleum-related VOCs and RCRA metals in groundwater and SVOCs and RCRA metals in subsurface soils. A complete list of all detected contaminants above applicable criteria along with their occurrence at the Site and behavior in the environment is included in Section 5.2. The applicable standards, criteria, and guidance values (SCGs) for the Site are listed below.

#### Soil

NYSDEC SCOs in 6 NYCRR Part 375-6.8(a) and (b) (effective December 14, 2006) Commercial Use Cleanup Objectives are most applicable to future use of the Site, based on Site location and planned future for commercial development. Contaminants of concern detected above Commercial Use SCOs are listed below and summarized in Tables 2 and 3. Contaminants of concern detected above Commercial Use SCOs are illustrated on Figure 11.1 and 11.2.

**COCs in Soil**

<u>SVOCs</u>	<u>Metals</u>
benzo(a)anthracene	barium
benzo(a)pyrene	cadmium
benzo(b)fluoranthene	chromium
dibenzo(a,h)anthracene	

**Groundwater-** NYS Class GA Groundwater Quality Standards from 6 NYCRR Parts 700-705 (NYS, 1999b) and, in the absence of a standard, guidance values in the NYSDEC Technical and Operational Guidance Series 1.1.1 (NYSDEC, 1998) are most applicable to future use of the Site based on location and planned future commercial development. These standards are based on groundwater as a drinking water source.

The following table lists groundwater COCs found to exceed applicable standards as detailed in Tables 3 and 3-1.

**COCs in Groundwater**

<u>VOCs</u>	<u>Metals</u>
acetone	chromium
chloroform	hexavalent chromium
benzene	lead
2-butanone	
1,4-dioxane	
toluene	
vinyl chloride	
trichloroethene	

A more complete presentation of analytical results is provided in the Sections 4 and 5 of this report.

**8.1.2 Development of Remediation Goals**

The process of defining the goals of a proposed remedial action is based on an engineering analysis of the expected benefits of the remedial effort as defined in the context of various evaluation criteria. As required in 6 NYCRR Part 375, the following criteria have been considered with respect to the effectiveness of remedial alternatives for the Site:

- Protection of Public Health and the Environment. This criterion is an evaluation of the remedy’s ability to eliminate or mitigate risks to human health and the environment during and after implementation of the remedial alternative that is selected.
- Compliance with Standards, Criteria, and Guidance. This criterion addresses whether the selected remedial alternative will ultimately result in compliance with SCGs, to the extent practicable. The chemical-specific SCGs for groundwater are referenced in 6 NYCRR Part 703.5 and TOGS 1.1.1.

- Long-term Effectiveness and Permanence. This criterion evaluates the long-term effectiveness of the remedy after implementation. This includes remaining risk to public health or the environment, adequacy and reliability of controls over time, and the ability to meet RAOs in the future.
- Reduction of Toxicity, Mobility, or Volume. This criterion evaluates the remedy's ability to reduce the toxicity, mobility, and volume of site contamination.
- Short-Term Impacts and Effectiveness. This is an evaluation of the potential short-term adverse impacts and risks of the remedy upon public health, workers, and the environment during implementation of the remedy. This includes an analysis of how the identified risks will be controlled and the effectiveness of those controls.
- Implementability. The implementability criterion evaluates the technical and non-technical feasibility of implementing a remedy. Technical feasibility includes the difficulties associated with construction and the ability to monitor the effectiveness of the remedy. Non-technical feasibility relates to the availability of necessary personnel and materials, ability to obtain approvals, access, etc.
- Cost Effectiveness. This criterion is used to select a remedy where cost of the remedy is proportional to overall effectiveness.
- Land Use. This criterion is intended to evaluate the remedial alternatives in relation to the current, intended, and reasonably anticipated future use of the Site.
- Community Acceptance. This criterion evaluates the public's comments, concerns, and overall perception of the remedy. Community acceptance will be evaluated after the public comment period, as part of the final remedy selection and approval.

## **8.2 General Response Actions**

General response actions are media-specific procedures used to meet established RAOs for the Site. These procedures involve remediation approaches that consist of various technologies and process options. General response actions for environmental media commonly include treatment, containment, extraction and/or disposal, and institutional actions (i.e., deed restrictions).

General response actions conducted at the Site to date as IRMs include the following:

- Asbestos abatement
- Building demolition
- Transformer removal and disposal
- Incidental materials recovery and disposal
- Remediation completed relative to AOCs 1, 2 and 3

This analysis recognizes the completed IRMs and will evaluate response actions (i.e., institutional controls) to address remaining soil contaminants exceeding Commercial Use SCOs as well as metals and VOC contamination in groundwater above NYS Groundwater Standards.

As required by regulation 6 NYCRR Part 375-4.8(d)(2), this analysis will also consider an alternative to achieve the Unrestricted Use SCOs in 6 NYCRR Part 375-6.8(a), which are considered to be representative of pre-disposal conditions at the Site. This option would allow any property use including the raising of livestock; although it should be noted that current zoning and land use plans would preclude the Site from such use. Regardless, the unrestricted use option will be included as a comparison to evaluate other alternatives. The Unrestricted Use evaluation will include response actions to address VOC and metals contamination in groundwater, and metals and SVOC contaminants in soil.

### **8.2.1 Soil**

Investigation results show the occurrences of SVOC and metals in subsurface soils that exceed Commercial Use SCOs, as depicted on Figure 11. These areas include the berm at the southern edge of the Site and contaminated materials identified within piping at TP-35 in the former "Low Rise" footprint. The contaminated materials in the piping are considered an issue that would be addressed during future Site development as directed by the SMP. The berm material would also be addressed under the SMP requirements.

Response actions were evaluated to meet the RAOs established for the Site. As part of the preliminary screening process, presumptive/proven remedial technologies in DER-15 were considered, as shown in the following table.

**Preliminary Screening of Soil Remedial Actions**

<b>Presumptive Remedy</b>	<b>Feasible</b>	<b>Rationale</b>
Soil Excavation and Disposal	No	Soils are presumed to be non-hazardous and acceptable for disposal as landfill cover; however, this would involve removing the majority of Site soil/fill material.
Immobilization/Stabilization	No	Not feasible due to the widespread nature of contamination.
Institutional/Engineering controls (cover, secure, deed restrictions)	Yes	Placement of clean cover material, deed restrictions, and implementation of a Site Management Plan can meet the RAOs for the Site.

The Site is currently securely fenced and vacant. No completed exposure pathways were identified in the exposure assessment. Due to the extensive amount of impacted fill/soil present at the Site, remediation would be complicated and costly. Therefore, the most practical approach to meet the established RAOs is through implementation of engineering and institutional controls.

Additional remedial actions were considered for evaluation of the Unrestricted Use Option, including: soil removal and disposal; and immobilization/stabilization treatment to address all impacted soils as shown on Figures 11.1 and 11.2. The total volume of surface and subsurface soils above Unrestricted Use SCOs is estimated to be 76,000 tons, assuming a soil weight of 1.5 tons/yd<sup>3</sup> and an average overburden depth of 8 feet.

**8.2.2 Groundwater**

The goal of the response actions is to address petroleum-related VOCs in groundwater in the former plating area and elsewhere on the site as indicated in Figure 7. Groundwater has been impacted by VOCs from former petroleum spills and by lead associated with leaded gasoline and other typical industrial uses. Hexavalent chromium is also present in groundwater as a result of past plating and metal finishing operations. As part of the preliminary screening process, presumptive/proven remedial technologies in DER-15 were considered, as shown in the following table.

**Preliminary Screening of Groundwater Remedial Actions**

<b>Presumptive Remedy<sup>1</sup></b>	<b>Feasible</b>	<b>Rationale</b>
Groundwater Extraction and Treatment	Yes	Technically complicated and costly, but feasible.
In-Situ Chemical Oxidation/Bioremediation	No	Traditionally ineffective in fractured rock aquifers. May be feasible, but need more detailed characterization of bedrock to determine if this would be an effective

Presumptive Remedy <sup>1</sup>	Feasible	Rationale
		remedial method.
Air Sparging	No	Largely ineffective in fractured rock aquifers due to the presence of preferential pathways.
Two-Phase Vacuum Extraction	No	Moderate non-saturated soil permeability and weathered bedrock surface affect feasibility.
Monitored Natural Attenuation	Yes	Detected compounds breakdown naturally over time. Would also require the use of institutional controls.
Institutional Controls	Yes	Deed restrictions and implementation of a Site Management Plan can meet the RAOs for the Site.

<sup>1</sup> – Remedies listed are intended to address one or more residual contaminant type(s)

No completed exposure pathways were identified in the exposure assessment. Interim remedial measures were performed to mitigate the presence of petroleum and Cr<sup>+6</sup> and prevent human exposure and/or migration of contamination. Thus far IRM efforts appear to be effective; however, additional groundwater monitoring is needed to determine the long-term effectiveness. Therefore, the established RAOs can be met through implementation of institutional controls including long-term groundwater monitoring.

Additional remedial options were considered to address groundwater exceeding NYS Groundwater Standards without the use of institutional controls for evaluation of the Unrestricted Use Option. Groundwater extraction and treatment was selected as the most appropriate remedial alternative for this evaluation.

### 8.3 Development of Alternatives

This section describes the technology types and process options that are appropriate to conditions and the nature and extent of contamination at the Site.

After a preliminary screening, the following general response actions have been identified to address residual soil and groundwater contamination at the Site:

- No Further Action
- Engineering/Institutional Controls and Long-Term Monitoring
- Unrestricted Use Option- Soil Removal and Disposal with Groundwater Extraction and Treatment

#### 8.3.1 Commercial Use Alternatives

The commercial use category allows for the buying, selling or trading of merchandise or services including public uses with limited potential for soil contact. Based on the City’s conceptual plan to develop the Site for commercial use, the location of the Site, and the surrounding land uses, this is the most

applicable land use category. Current zoning would also support future commercial Site use.

#### No Further Action

The No Further Action alternative is included as a baseline to evaluate other alternatives. This alternative recognizes the IRMs already completed, and proposes no additional remedial work. The Site condition would remain as is, and future use would not be limited.

#### Engineering/Institutional Controls with Long-Term Monitoring

Under this alternative, long-term groundwater monitoring would be conducted to track contaminant migration and degradation over time. Engineering controls (i.e., site cover) would be implemented to prevent exposure to surface and subsurface soil contamination at the Site. In addition, institutional controls (e.g., deed restriction to control property use) and development of an SMP, including a Soil Management Plan and Health and Safety Plan (HASp), would be implemented to mitigate potential exposures during future development or site use.

### **8.3.2 Unrestricted Use Alternative**

As required by regulation 6 NYCRR Part 375-4.8(d)(2), this analysis will consider an alternative to achieve the Unrestricted Use SCOs in 6 NYCRR Part 375-6.8(a), which are considered to be representative of pre-disposal conditions at the Site. This option would allow any property use including the raising of livestock; although it should be noted that location and parcel size limitations would preclude the Site from such use. Therefore, the unrestricted use option will be included only as a comparison to evaluate other alternatives.

Both soil and groundwater contamination would need to be remediated for future Site use to be unrestricted. This would involve excavation and off-site disposal of surface and sub-surface soil exceeding Unrestricted Use SCOs and groundwater treatment to achieve the NYS Groundwater Standards. Preliminary screening deemed groundwater extraction and treatment as the most appropriate remedy to attain groundwater standards.

#### Soil Excavation and Disposal

The total volume of soil/fill (surface and sub-surface) exceeding Unrestricted Use SCOs is estimated to be approximately 76,000 tons, assuming a soil weight of 1.5 tons/yd<sup>3</sup>. The average contaminated zone for sub-surface soil is estimated to be 1-8 feet below grade.

Confirmatory soil samples would be collected to demonstrate effective removal of contaminated soil/fill. Excavated areas would be backfilled with clean soil/fill material from an approved source.

In-Situ Groundwater Remediation and Groundwater Extraction and Treatment

Since the Unrestricted Use category does not allow for groundwater use restrictions on the property, groundwater treatment would be required to address residual impacts in the vicinity of the former plating area and the northern and western portions of the Site as indicated on Figure 9. A combination of in-situ groundwater remediation and groundwater extraction and treatment (GWET) is evaluated to remediate contamination above NYS Groundwater Standards. In-situ remediation by reduction of  $\text{Cr}^{+6}$  to immobile and insoluble  $\text{Cr}^{+3}$  is evaluated. GWET is an ex-situ technology involving the installation of pumping wells in the plume area to artificially depress the potentiometric surface so that contaminated groundwater flows toward the pumping wells. Groundwater is extracted from the wells and treated using an air stripper to volatilize contaminants from groundwater to air.

An SMP including operations and maintenance activities would also need to be implemented.

## 9.0 Detailed Development of Alternatives

### 9.1 Individual Analysis of Alternatives

Each of the alternatives identified in Section 8.3 are further evaluated in detail in this section of the report.

#### 9.1.1 Commercial Use Options

These alternatives are further defined below.

##### No Further Action

Under this alternative, soil and groundwater would remain unremediated and future Site use and development would not be limited. This alternative may not be protective of human health since no institutional controls would be implemented to mitigate potential future exposures. Except for natural attenuation of VOCs and metals in groundwater, this alternative would not result in the measurable reduction of contaminant toxicity, mobility, or volume and may not attain compliance with NYS Groundwater Standards.

There would be no increased short-term risks associated with the No Action alternative since remedial activities are not implemented; however, the alternative may not be effective in the long-term and is not considered a permanent remedy.

Based on the findings of the investigation performed to date, it is anticipated that this alternative would not be acceptable to the community or appropriate in regards to potential future redevelopment of the Site.

##### Engineering/Institutional Controls with Long-Term Monitoring

This alternative includes long-term groundwater monitoring, engineering controls to prevent exposures, institutional controls (e.g., deed restriction to control site use), and development of a SMP (including HASP). The SMP would include procedures for properly handling and disposing of impacted soil and/or below grade utilities that may contain elevated concentrations of COCs such as the piping identified at TP-35, should it be disturbed in the future. Groundwater monitoring will include annual sampling of selected wells as approved by the City and NYSDEC.

To prevent future exposures and migration of contaminants, a site cover would be placed over areas of the Site where soils exceeding Commercial Use SCOs, as shown on Figure 11, are exposed. The cover may consist either of structures such as buildings, pavement, sidewalks or a soil cover of at least one foot. Soil

cover must meet SCOs for cover material as set forth in 6 NYCRR Part 375-6.7(d) for commercial use. Maintenance of the site cover will be required in the SMP.

Placement of a soil cover on the Site is will likely be a component of future re-development and is considered feasible. If a soil cover is not a component of Site re-development, it is recommended that the impacted areas remain fenced and secured with a locked gate to prevent human contact with surface soil exceeding Commercial Use SCOs.

The land use restrictions would be in the form of an environmental easement granted to the NYSDEC that requires:

- commercial use, which will also permit industrial use;
- compliance with an approved SMP;
- restricting the use of groundwater as a source of potable or process water, without necessary water quality treatment as determined by NYSDOH;
- and the property owner to complete and submit an annual certification of institutional controls.

This alternative would also include development of a SMP which will include:

- an Excavation Plan outlining procedures for proper handling and disposal of impacted soil that may be encountered;
- a HASP to protect the health and safety of site workers;
- a groundwater monitoring program;
- provisions to evaluate the potential for soil vapor intrusion should any building be developed on the Site and to implement actions (e.g., mitigation) recommended to address exposures related to soil vapor intrusion; and
- which will describe the use restrictions along with procedures for maintenance of the Site remedy.

Results of the annual groundwater sampling would be submitted to the NYSDEC and NYSDOH, along with a certification that the any required engineering and institutional controls are in place and able to protect public health and the environment.

This alternative would be protective of human health and the environment since it will mitigate potential future exposures to contaminated soil and groundwater and provide guidance for future ground intrusive work that may disturb impacted soils beneath the cover. The only additional reduction of contaminant toxicity, mobility, or mass would be a result of natural attenuation processes. There would be no increased short-term risks associated with this alternative

since remedial activities are not implemented. This alternative should be effective in the long-term; however, it may not be a permanent remedy.

Based on the investigation findings to date, it is anticipated that this alternative would meet the criteria described in Section 8.2.2. It is technically feasible, cost effective, and relatively easy to implement for the Site.

### **9.1.2 Unrestricted Use Option**

#### Soil Excavation and Disposal

Under this alternative, a large portion of onsite soil/fill would be removed down to bedrock. The widespread nature of soil/fill contaminants and the presence of subsurface utilities limit the feasibility of excavation and off-site disposal as a remedial alternative.

The total volume of surface and subsurface soils above Unrestricted Use SCOs is estimated to be 76,000 tons, assuming a soil weight of 1.5 tons/yd<sup>3</sup> and an average overburden depth of 8 feet.

Municipal forces could potentially be utilized to complete the soil/fill removal, staging, loading, and backfill activities, pending their availability. For purposes of this evaluation, it is assumed that the work will be subcontracted and prevailing wage rates apply. Based on analytical results, the excavated material would be classified as non-hazardous waste. Excavated material would be transported off-site to a permitted disposal facility. Clean backfill would be used to bring excavated areas back to existing grade. To facilitate soil/fill removal, demolition of concrete building slabs and foundation will be necessary for removal of soil throughout the Site.

Post-removal confirmatory samples will be collected to demonstrate successful removal of impacted soil/fill. Bottom samples would not be required if soil/fill were removed down to bedrock. During excavation, air monitoring would be performed as specified in the Community Air Monitoring Plan (CAMP) and HASP.

#### In-Situ Groundwater Remediation and Groundwater Extraction and Treatment (GWET)

A two-phase program would be used to address chromium, lead and VOC contaminants remaining in groundwater after completion of the soil removal process. Initially, a molasses injection program would be implemented in the former plating area to reduce residual concentrations of Cr<sup>+6</sup> to the insoluble Cr<sup>+3</sup> state. This would be accomplished by the direct injection of a 5% solution of food-grade molasses into the subsurface in the affected area of the Site using a Geoprobe® or similar equipment. Monitoring would be completed periodically and the second phase of remediation would be initiated after Cr<sup>+6</sup>

concentrations have been consistently reduced to below groundwater standards.

A GWET system would be utilized to treat residual groundwater concentrations above NYS Groundwater Standards in the vicinity of the former Plating Area as well as the northern and western areas of the Site where elevated levels of lead were identified. Typically, a GWET system is designed so that the capture zone is sufficient to cover the lateral extent of the area of concern. Based on the hydrogeologic characterization of the Site completed to date, it is estimated that approximately 1,000 gallons per day may need to be extracted and treated by the system. The total number and location of extraction wells would be determined by a pumping test conducted during the design phase. Well installation would involve rock coring.

Extracted groundwater would be pumped from the extraction wells and transferred via underground piping to an enclosure containing a multi-tray air stripper. Influent water flows into the air stripper, over a weir and through a series of sieve/aeration trays as it descends to a sump at the bottom of the unit. Air is simultaneously drawn up through the sieve holes in each tray forming a froth of bubbles, generating a large gas/liquid contact surface area. Depth of froth and unit air-to-water ratio are carefully controlled to optimize the contaminant removal process. This allows mass transfer of contaminants from the water into the rising air, which is exhausted at the top of the unit. A carbon "polish" would be required to remove lead.

An air permit is not anticipated to be required at this Site, based on groundwater analytical results. If needed, the exhaust may be passed through a treatment device such as activated carbon. A permit would be necessary for discharge of treated effluent water, along with periodic sampling. An operations and maintenance (O&M) plan would be developed for regular system checks and performance monitoring.

Groundwater concentrations would be monitored through a groundwater sampling program to verify system performance. Samples would be analyzed for COCs to monitor the effectiveness of the treatment program.

This alternative is the most conservative of the three alternatives considered and would be protective of human health and the environment by remediating soil contaminant concentrations above Unrestricted Use SCOs from the Site and decreasing groundwater contaminant concentrations to levels below applicable NYS groundwater standards.

Soil and groundwater remediation will reduce the toxicity, mass, and mobility of hazardous substances at the Site by chemical alteration and physical removal of the contaminant mass and subsequently preventing off-site migration. It should be noted that soil contamination would not be destroyed, just transferred to a controlled disposal facility. Groundwater contaminants would be transferred from groundwater to the atmosphere; VOCs breakdown naturally in the atmosphere.

There would be an increase in short-term risks associated with the soil removal work and implementation of the groundwater treatment program. Work areas would need to be secured to minimize potential safety issues. These risks could be managed through implementation of a CAMP and HASP. There is also the potential for human exposure to airborne contaminants in the vicinity of the GWET system exhaust. The system would be engineered so as to minimize these exposures.

This alternative is a permanent remedy and would be effective in the long-term. Based on investigation findings to date, it is anticipated that this alternative may meet the criteria described in Section 8.1.2; however, there are technical limitations, safety considerations, and the costs are high.

**9.2 Comparative Analysis**

A comparative evaluation of the remedial alternatives is presented in the form of a matrix, provided in the table below. It is noted that the Unrestricted Use Alternative is included herein for comparison only and that the City of Rochester is not considering Unrestricted Use as a viable goal for the subject Site.

**Qualitative Comparison of Remedial Alternatives**

Criteria	Commercial Use Alternatives		Unrestricted Use Alternative
	No Further Action	Institutional/Engineering Controls w/ Long-Term Monitoring	Soil Excavation/Disposal & Groundwater Extraction/Treatment
<b>Protection of Public Health &amp; Environment</b>	Not adequately protective of human health or the environment.	Potential exposures are mitigated through use of engineering and institutional controls and monitored for groundwater attenuation.	Most protective of human health and the environment.

Criteria	Commercial Use Alternatives		Unrestricted Use Alternative
	No Further Action	Institutional/Engineering Controls w/ Long-Term Monitoring	Soil Excavation/Disposal & Groundwater Extraction/Treatment
<b>Compliance with SCGs</b>	Does not comply with NYS groundwater standards or Part 375 SCOs.	Concentrations exceed SCGs, but would be monitored and Site use would be restricted.	Will mitigate groundwater and soil contamination.
<b>Long-Term Effectiveness/Permanence</b>	Not an effective or permanent long-term remedy.	Effective in the long-term; however, may not be a permanent Residual remedy. impacted soil and groundwater would need to be managed by Site Management Plan (SMP).	This is a permanent remedy; however, may be limited by existing site conditions such as underground utilities. Requires long-term O&M.
<b>Reduction of Toxicity, Mobility, or Volume</b>	Only natural attenuation of contaminants.	Only natural attenuation of contaminants.	Soil and groundwater contaminants will be removed and off-site migration limited.
<b>Short-Term Effectiveness/Permanence</b>	No short-term risks or adverse impacts.	No short-term risks or adverse impacts.	Increased risks during implementation need to be addressed by HASP and CAMP.
<b>Implementability</b>	Very easy	Moderate	Difficult
<b>Land Use</b>	Not a suitable remedy for intended commercial use.	Suitable remedy for intended commercial use.	Would allow any future land use, but may still require deed restrictions to address residual inaccessible contamination.
<b>Estimated Duration of Remedy</b>	0 years	Monitoring: 5 years Engineering/Institutional Controls: Unlimited (assume 30 years)	1-2 years O&M: 3 years

As shown in the matrix, the Unrestricted Use Alternative is the most permanent remedy, but also presents the most short-term risks to workers, is the most difficult to implement, and has the highest cost of all the alternatives evaluated. However, it is understood that the City of Rochester is not giving further consideration to unrestricted Site use and has selected Commercial Reuse as the only viable option for the Site.

The No Further Action alternative is not considered adequately protective of human health because it does not limit Site use, prevent potential exposures, or limit the use of Site groundwater as a drinking water source.

The Engineering/Institutional Controls with Long-Term Monitoring Alternative addresses potential future exposure concerns by requiring a cover over impacted soils and tracking groundwater contaminant degradation over time. This alternative accounts for source removal IRMs already completed; relies on the use of engineering/institutional controls to address widespread soil contamination from past industrial use of the Site; and assumes natural attenuation of contaminants over time to decrease residual groundwater impacts.

All of the alternatives may leave residual soil and groundwater contamination on the subject Site. Based on current Site conditions including being secured by fencing and vacant, it is concluded that no completed exposure pathways were identified in the exposure assessment with regard to soil or groundwater contamination.

### **9.3 Recommended Remedy**

No Further Action with Engineering/Institutional Controls and long-term monitoring is the recommended remedial alternative for this Site, based on the criteria in Section 8.1.2. This alternative would satisfy the RAOs developed for the Site and render the Site suitable for commercial use, including passive recreational uses. Additional soil and groundwater remedial efforts do not justify the exorbitant cost and short-term risks, considering that all exposure pathways can be eliminated through use of Engineering/Institutional Controls while still allowing full intended use of the Site.

**Project:** Whitney Hazardous Materials Inventory Sampling Results

Lu Project No.: 4216

---

Samples of potential hazardous materials were obtained from the Whitney Street site on August 30 and 31, 2006. Additional samples were also collected on September 8, 2006 and October 16, 2006.

The following is a list of the items/areas of concern for the waste removal required as part of asbestos abatement and demolition of the Whitney Street Site. The lettered items below correspond to the sample summary table and locations noted on the site plans attached.

- A. None of the surface wipes, concrete chip samples or oil samples contained PCBs. The location of the oil-containing equipment and containers is noted on the attached site plans. The oils will need to be drained from the equipment and or containers and appropriately disposed of as waste oil.
- B. The sandblast material located in the sandblast hood in the vehicle repair bay needs to be disposed of as hazardous waste due to elevated levels of RCRA Metals.
- C. The hydraulic lift system and associated pipe trenches located in the vehicle repair bay were unable to be accessed; this system is below grade and not anticipated to be encountered during demolition. If oil-containing piping and/or reservoirs are encountered these items should be secured and staged during demolition to be assessed for sampling and appropriate disposal. Otherwise oils encountered should be collected and disposed of as used oil.
- D. The overhead crane and the window mechanisms located in the Engine Room were unable to be accessed for sampling. This equipment should be secured and staged during demolition to be assessed for sampling and appropriate disposal. Otherwise oils encountered should be collected and disposed of as used oil.
- E. No oils were observed in the upper level electrical equipment of the Engine Room. Care should be taken in demolishing this equipment. In the event that oils are encountered, these items should be secured and staged during demolition to be assessed for sampling and appropriate disposal.

- F. The wood block flooring located in between the vehicle repair area and the Engine Room is not hazardous waste. This material can be disposed of as C&D debris.
- G. Two hoppers are located on the roof, one on the south east section and one on top of the north elevator gear house. These hoppers were inaccessible for sampling due to structural concerns with the roof. The hoppers appear to be empty of materials but will need to be staged during demolition for evaluation prior to disposal.
- H. All ash material sampled from the boiler, the flue duct leading from the boilers to the stack, and from the inside of the stack is hazardous waste due to elevated concentrations of arsenic.
- I. The sediment located in the north floor drain of the vehicle repair bay is hazardous waste due to elevated concentrations of RCRA Metals. This material is below grade and is not anticipated to be encountered during this phase of demolition.
- J. The three water samples from the flooded tunnel/basement area did not contain detectable levels of PCBs. Lu Engineers was not able to sample sediment located in these areas at that time, but since the area is below grade it is not anticipated to be encountered during this phase of demolition.
- K. The South Elevator was inaccessible for sampling, and only the gear house of the north elevator was inspected. The remaining portions of these elevator systems, along with an air handling unit on the south east roof of the Brick Mill should be staged for evaluation and possible sampling during demolition to determine appropriate disposal of any oils or other materials.
- L. The tunnel located beneath the location of the former location of Building 3, accessible only from the courtyard contained approximately 6 unknown drums and another approximately 18 empty drums. These drums will need to be moved to the east end of the tunnel and staged for sampling and disposal.
- M. One unknown wooden drum and one 55-gal oil drum will be removed from the boiler room. One 55-gal drum located in the northwest portion of the second floor. Approximately 10 small 3 to 5-gal containers are also located on the mezzanine level of the second floor near the South East staircase. These items should be staged and evaluated for disposal.
- N. Debris piles should be sifted for potential hazardous materials. Any such materials should be staged and sampled for disposal.
- O. All light fixtures throughout the building should be staged and evaluated for PCB containing ballasts prior to disposal. An initial inventory of the building found approximately 130 PCB containing ballasts and 160 unknown but suspect PCB containing ballasts.

- P. All fluorescent light bulbs shall be removed prior to demolition and disposed of appropriately. An initial inventory of indicated approximately 200 fluorescent bulbs.
- Q. Three transformers located on the 6<sup>th</sup> floor exterior of the Orchard Street Building between the southeast staircase and the south east elevator should be removed and transported offsite for appropriate disposal of PCB oils.
- R. Various paint containers will be staged for screening and characterization for disposal.
- S. Approximately 20 bags of populated circuit board wastes are located in the passageway between the Engine Room and the Boiler Room. These materials should be recycled.
- T. Pigeon droppings are located in varying amounts on the majority of interior building surfaces. Care should be exercised during demolition to prevent excessive disturbance of pigeon droppings and release of resultant airborne dusts.

### Hazardous Materials Removed from the Site

The following materials were disposed of from the Site in July 2008.

CONTAINER #	CONTAINERS	CONTENTS	ANALYTICAL	HAZARDOUS WASTE
1	1 - 1cubic yard box (lined)	Waste circuit boards contaminated with asbestos	None	Yes
2	1 – 30 gallon poly drum	Sand blast waste	Yes	Yes
3	1 – 55 gallon fiber drum	Paint-related wastes	None	No
4	1 – 55 gallon fiber drum	Paint-related wastes	None	No
5	1 – 55 gallon fiber drum	Paint-related wastes	None	No
6	1 – 55 gallon fiber drum	Paint-related wastes	None	No
7	1 – 5 gallon bucket	Aerosol paint waste	None	Yes
8	1 – 55 gallon steel drum	Waste circuit boards contaminated with asbestos	None	Yes
9	1 – 55 gallon steel drum	Waste circuit boards contaminated with asbestos	None	Yes
10	1 – 55 gallon steel drum	Oil from large transformers (Transformer/Lube Oil)	Yes	Yes
11 - 18	1 – 55 gallon steel drum	Spill cleanup materials and soil with asbestos	Yes	Yes
19	1 – 85 gallon plastic overpack	Waste oil with lead	Yes	Yes
20	1 – 85 gallon plastic overpack	Waste oil (Transformer/Lube Oil)	Yes	Yes
21	1 – 85 gallon plastic overpack	Acidic boiler treatment	Yes	Yes
22	1 – 85 gallon plastic overpack	Caustic cleaner material	Yes	Yes
23	1 – 85 gallon plastic overpack	Propylene glycol	None	Yes

C. Waste Stream Information

- [x] USEPA Hazardous [ ] State Hazardous [x] TSCA [ ] Non-Hazardous

- 1. Description
a. Name of Waste: Circuit Boards c/w Asbestos
b. Process Generating Waste: Removal of Circuit Boards during Demolition
c. Color: Varies
d. Strong Odor (describe): NONE
e. Physical State at 70°F: [x] Solid [ ] Liquid [ ] Gas [ ] Sludge [ ] Other:
f. Layers? [x] Single layer [ ] Multi-layer
g. Free Liquid Range (%) 0 to 0 Specific Gravity: 1.3 Viscosity: HIGH BTU/lb: N/A
h. pH Range: 5 to 9
i. Liquid Flash Point: [ ] < 73°F [ ] 73°-99°F [ ] 100°-139°F [ ] 140°-199°F [ ] > 200°F [x] N/A
2. Is this a USEPA hazardous waste (40 CFR Part 261)? If the answer is no, skip to question f
a. If yes, identify ALL USEPA listed and characteristic waste code numbers (D,F,K,P,U)
D008
b. If a characteristic hazardous waste, do underlying hazardous constituents(UHCs) apply-(40 CFR 268.48)? [ ] Yes [x] No
c. Is the waste subject to RCRA Subpart CC Controls-(40 CFR 264.1083 & 265.1084)? [ ] Yes [x] No [ ] ? Click for Add'l Info
d. Is the waste predominately debris subject to the Alternate Debris Standards (40 CFR 268.45)? [x] Yes [ ] No
e. Is the waste predominately soil subject to the Alternate Soil Treatment Standards-(40 CFR 268.49)? [ ] Yes [x] No
f. Does the waste represented by this profile contain asbestos? [x] Yes [ ] No
g. Does the waste represented by this profile contain benzene? [ ] Yes [x] No

Containers # 1, 8 x 9 (No analyt.) May 2007

Generator's Hazardous Waste Profile Sheet

Profile Number

C. Waste Stream Information (continued)

- h. Is this profile for remediation waste from a facility that is a major source of Hazardous Air Pollutants...
i. Does the waste represented by this waste profile sheet contain concentrations of Polychlorinated Biphenyls (PCBs) regulated by 40 CFR 761?
j. Chemical Composition (List all constituents [including halogenated organics, debris, and UHC's] present in any concentration and submit representative analysis):

Table with 5 columns: Constituents (Total Composition Must be > 100%), Lower Range, Unit of Measure, Upper Range, Unit of Measure. Row 1: Circuit Boards w/ Lead, 98, %, >99, %. Row 2: Asbestos Fibers, 0, %, <2, %.

- k. Check any that apply: Pyrophoric, Water Reactive, OSHA Carcinogen, Shock Sensitive, Oxidizer, Infectious
l. Is the waste subject to controls as a Group 1 wastewater or residual under the Hazardous Organic NESHAP?
m. Does the waste represented by this waste profile sheet contain radioactive material?
n. Is the waste from a CERCLA (40 CFR 300, Appendix B) or state mandated clean-up?
o. Is this a State Hazardous Waste?

D. DOT Information and Shipping Volume

- 1. Quantity of Waste
a. Event, Base/Ongoing (check one)
b. Estimated Annual Quantity: 1 X YD3 Box & 2 X 55DM
c. Shipping Frequency: Units: Per: Month, Quarter, Year, One Time, Other
2. Shipping Information
a. Packaging: Roll off/End dump, Drum Type/Size: 1A2 - 55Gallon, Tanker, Super Sack, Tote Bin, Cubic Yard Boxes, Vacuum Box, Other
b. Is this a U.S. Department of Transportation (USDOT) Hazardous Material?
c. Reportable Quantity (lbs.; kgs.): 10lbs
d. Primary/Subsidiary Hazard Class(es)/ID#: 9 NA3077
e. USDOT Shipping Name: RQ Hazardous Waste, Solid, n.o.s. ( Contains Lead ) PG: III

E. Generator Certification (Please read and certify by signature below)

I hereby certify that all information submitted in this and all attached documents contain true and accurate descriptions of this wastestream. Any sample submitted is representative as defined in 40 CFR 261 - Appendix 1 or by using an equivalent method. I authorize WMI to obtain a sample from any waste shipment for purposes of recertification.

# Generator's Hazardous Waste Profile Sheet

Profile Number

### C. Waste Stream Information (continued)

- h. Is this profile for remediation waste from a facility that is a major source of Hazardous Air Pollutants (Site Remediation NESHA, 40 CFR 63 subpart GGGGG)?  Yes  No  
If yes, does the waste contain <500 ppm VOHAPs at the point of determination?  Yes  No
- i. Does the waste represented by this waste profile sheet contain concentrations of Polychlorinated Biphenyls (PCBs) regulated by 40 CFR 761? (if yes, list in Chemical Composition - C.2.j)  Yes  No  
Were the PCBs imported into the U.S.?  Yes  No  
Are PCBs regulated under the "Self-Implementing Remediation Section of (Mega) Rule?" 40CFR 761,61(a)  Yes  No
- j. Chemical Composition (List all constituents [including halogenated organics, debris, and UHC's] present in any concentration and submit representative analysis):  (See Attached - for entering additional constituents)

Constituents (Total Composition Must be > 100%)	Lower Range	Unit of Measure	Upper Range	Unit of Measure
1. Circuit Boards w/ Lead	98	%	>99	%
2. Asbestos Fibers	0	%	<2	%
3.				
4.				
5.				
6.				

- k. Check any that apply:  Pyrophoric  Water Reactive  OSHA Carcinogen  Shock Sensitive  Oxidizer  Infectious
- l. Is the waste subject to controls as a Group 1 wastewater or residual under the Hazardous Organic NESHA?  Yes  No  
If yes, is it a Table 8 \_\_\_\_\_ or Table 9 \_\_\_\_\_ compound?
- m. Does the waste represented by this waste profile sheet contain radioactive material?  Yes  No  
Is disposal regulated by the Nuclear Regulatory Commission?  Yes  No  
If NORM, identify isotopes and concentration, \_\_\_\_\_ pCi/g
- n. Is the waste from a CERCLA (40 CFR 300, Appendix B) or state mandated clean-up?  Yes  No  
If yes, attach Record of Decision (ROD), 104/106 or 122 order or court order that governs site clean-up for activity.  
For state mandated clean-up, provide relevant documentation.
- o. Is this a State Hazardous Waste?  Yes  No If yes, please list applicable codes \_\_\_\_\_  
If NY waste codes B001-B007 apply, please complete question C.2.c on page 1.

### D. DOT Information and Shipping Volume

- 1. Quantity of Waste
  - a.  Event  Base/Ongoing (check one)
  - b. Estimated Annual Quantity: 1 X YD3 Box & 2 X 55DM  Tons  Yards  Drums  Other (specify) \_\_\_\_\_
  - c. Shipping Frequency: Units: \_\_\_\_\_ Per:  Month  Quarter  Year  One Time  Other \_\_\_\_\_
- 2. Shipping Information
  - a. Packaging:
    - Roll off/End dump: \_\_\_\_\_  Other: \_\_\_\_\_
    - Drum Type/Size: 1A2 - 55Gallon  Vacuum Box
    - Tanker  Super Sack  Tote Bin  Cubic Yard Boxes
  - b. Is this a U.S. Department of Transportation (USDOT) Hazardous Material? (If no, skip c, d and e)  Yes  No
  - c. Reportable Quantity (lbs.; kgs.): 10lbs d. Primary/Subsidiary Hazard Class(es)/ID#: 9 NA3077
  - e. USDOT Shipping Name: RQ Hazardous Waste, Solid, n.o.s. (Contains Lead) PG: III

### E. Generator Certification (Please read and certify by signature below)

I hereby certify that all information submitted in this and all attached documents contain true and accurate descriptions of this wastestream. Any sample submitted is representative as defined in 40 CFR 261 - Appendix 1 or by using an equivalent method. I authorize WMI to obtain a sample from any waste shipment for purposes of recertification. If this certification is made by a broker, the undersigned signs as authorized agent of the generator and has confirmed the information contained in this Profile Sheet from information provided by the generator and additional information as it has determined to be reasonably necessary. If approved for management, Contractor has all the necessary permits and licenses for the waste that has been characterized and identified by this approved profile. All relevant information within the possession of the Generator regarding known or suspected hazards pertaining to the waste will be disclosed to the contractor. All changes which occur in the character of the waste will be identified by the Generator and be disclosed to the Contractor prior to providing the waste to the Contractor.

## VRA LOOSE PACKS

- 1) INORG LOOSE PACKS MAY NOT CARRY DILUTION RULE CODES
- 2) ALL INNER CONTAINERS MUST BE 5 GALLONS OR LESS

- 005L - FLAMMABLE LIQUIDS LOOSEPACK
- 006L - WATER AND SOLVENT BASED PAINTS LOOSEPACK
- 010L - WASTE PESTICIDES, HERBICIDES, INSECTICIDES LOOSEPACK
- 030X - WASTE HYDRIDES LOOSEPACK
- 031L - ISOCYANATES / RESINS LOOSEPACK
- 040X - ACROLEIN LOOSEPACK
- 050X - SULFIDES LOOSEPACK
- 060X - SODIUM AZIDE LOOSEPACK
- 070X - FLAMMABLE SOLIDS LOOSEPACK
- 071L - WASTE METAL POWDERS IN CONSUMER PACKAGES
- 072X - ALKALI METALS LOOSEPACK
- 073X - PHOSPHORUS (WHITE OR YELLOW) LOOSEPACK
- 074X - NITROCELLULOSE LOOSEPACK
- 080X - MERCAPTANS LOOSEPACK
- 090X - POISON (TOXIC) LOOSEPACK
- 100L - INORGANIC ACIDS LOOSEPACKS
- 101L - ORGANIC ACID LOOSEPACK
- 110X - PICRIC ACID LOOSEPACK
- 120X - PYROPHORIC LIQUIDS LOOSEPACK
- 130X - ACIDIC, WATER-REACTIVE LOOSEPACK
- 150X - SILANE LOOSEPACK
- 200L - BASE LOOSEPACK
- 206X - CORROSIVE POISONS LOOSEPACK
- 210L - ALKYLAMINE LOOSEPACK
- 270X - HYDRAZINE LOOSEPACK
- 700L - NON - HAZ LOOSE PACK
- 795L - PESTICIDES WITH CARBAMATES

**1. GENERATOR INFORMATION (Heritage# ) \***

Generator Name 354 Whitney Street  
 Address 354 Whitney Street  
 City, State, Zip Rochester, NY 14606  
 Tech. Contact Name Anne Spaulding  
 Phone 585-428-7474 Fax  
 24 Hour Emergency Number  
 E-mail Address  
 US EPA ID Number NYR000158204  
 State ID Numbers  
 Status LQG  SQG  CESQG  Non-hazardous

**2. BILLING INFORMATION (Heritage # ) \***

Customer Name Advanced Waste Solutions, Inc.  
 Address PO Box 904  
 City, State, Zip Lockport, NY 14095  
 Contact Name Mike Herlan  
 Phone (716)439-1221 Fax (716)439-1222  
 E-mail Address

**3. MANIFEST MAIL ADDRESS (If different from generator)**

Contact Name Anne Spaulding  
 Company Name City of Rochester  
 Address 30 Church St. - City Hall - Room 300-B  
 City, State, Zip Rochester, NY 14614

4. Generator SIC Code If 3312, do you perform Coke Oven Byproduct Recovery Operations? Yes  No  If 28\_\_, 2911, 3312, or 4953, what is the Total Annual Benzene (TAB) in Megagrams/year?

5. Common Name Aerosol Spray Cans

6. Process Generating Waste Discarding of Material During Facility Demolition

7. DOT Description \* (if available)  
Waste Aerosols, Flammable 2.1 UN1950

8. Identify US EPA waste codes D001, D035

9. If D001-D043, are any Underlying Hazardous Constituents (UHCs) present? Yes  No  NA  If yes, list in Section 13.

10. If F001-F005, or F039, list the F-listed hazardous constituents in Section 13.

11. US EPA Form Code \* W209 US EPA Source Code \* G11

12. Identify state waste codes

13. Waste Composition: Using specific chemical names and/or descriptions of waste composition, list all constituents present in the wastestream, and identify those that are underlying hazardous constituents (UHCs), or F001-F005/F039 hazardous constituents. Attach available analysis or MSDSs. Total composition must equal or exceed 100%.

Constituents	Range	Units	UHC?	F-Listed?
Aerosol Spray can w/ Acetone, Xylene, Toluene & Petr. Distillates (Paints, Coatings & Lubricants)	100	%	Yes <input type="checkbox"/>	Yes <input type="checkbox"/>
			Yes <input type="checkbox"/>	Yes <input type="checkbox"/>

21. CERTIFICATION Sign and date the certification.

I hereby certify that I am an authorized agent of the generator, and warrant on behalf of the generator, that all information submitted herein and attached documentation contains true, accurate and complete descriptions of this material. Any sample submitted for analysis is representative of the material being offered for approval. All relevant information regarding known or suspected hazards in the possession of the generator has been disclosed. I will notify Heritage Environmental Services, LLC or Von Roll America, Inc. of any changes in generator status, any information on this form, or any information on the attachments. This certification and signature apply to this form, to all attachments checked in section 20, and to the land disposal restriction notification (LDR) generated from this information.

Signature \_\_\_\_\_ Printed Name \_\_\_\_\_ Date \_\_\_\_\_ Company \_\_\_\_\_

22. COMPLETE THIS SECTION FOR NON-HAZARDOUS MATERIAL BEING MANAGED TO A NON-HAZARDOUS PROCESS (EXAMPLE: SUBTITLE D LANDFILL or MASS-BURN)

# Generator's Hazardous Waste Profile Sheet

Service Agreement on file?  Yes  No Profile Number \_\_\_\_\_

Check here if there are multiple generating locations for this waste. Attach additional locations.

Check here if a Certificate of Destruction or Disposal is required

Requested Disposal Facility \_\_\_\_\_

Renewal for Profile Number \_\_\_\_\_ Waste Approval Expiration Date \_\_\_\_\_

### A. Waste Generator Facility Information (must reflect location of waste generation/origin)

- 1. Generator Name: 354 Whitney Street
- 2. Site Address: 354 Whitney Street
- 3. City/ZIP: Rochester 14606
- 4. State: NY
- 5. County: Monroe
- 6. Contact Name/Title: Anne Spaulding
- 7. Email Address: \_\_\_\_\_
- 8. Phone: (585) 428-7474
- 9. FAX: \_\_\_\_\_
- 10. NAICS Code: 336399
- 11. Generator USEPA ID #: NYR000158204
- 12. State ID# (if applicable): \_\_\_\_\_

### B. Customer Information same as above

P. O. Number: \_\_\_\_\_

- 1. Customer Name: Advanced Waste Solutions, Inc.
- 2. Billing Address: PO Box 904
- 3. City, State and ZIP: Lockport, NY 14095
- 4. Contact Name: Mike Herlan
- 5. Contact Email: mherlan@verizon.net
- 6. Phone: 7164391221 FAX: 7164391222
- 7. Transporter Name: TBD
- 8. Transporter ID # (if appl.): \_\_\_\_\_
- 9. Transporter Address: \_\_\_\_\_
- 10. City, State and ZIP: \_\_\_\_\_

### C. Waste Stream Information

USEPA Hazardous  State Hazardous  TSCA  Non-Hazardous

- 1. Description
  - a. Name of Waste: Oil Spill Clean-Up c/w Asbestos
  - b. Process Generating Waste: Collection of Dirt, Speedi-Dry and Spill Clean-Up Materials
  - c. Color: Blackish/Brown
  - d. Strong Odor (describe): NONE
  - e. Physical State at 70°F:  Solid  Liquid  Gas  Sludge  Other: \_\_\_\_\_
  - f. Layers?  Single layer  Multi-layer
  - g. Free Liquid Range (%) 0 to 0 Specific Gravity: 1.5 Viscosity: HIGH BTU/lb: N/A
  - h. pH Range: 5 to 9
  - i. Liquid Flash Point:  < 73°F  73°-99°F  100°-139°F  140°-199°F  > 200°F  N/A
- 2. Is this a USEPA hazardous waste (40 CFR Part 261)? If the answer is no, skip to question f
  - a. If yes, identify ALL USEPA listed and characteristic waste code numbers (D,F,K,P,U) \_\_\_\_\_
  - b. If a characteristic hazardous waste, do underlying hazardous constituents(UHCs) apply-(40 CFR 268.48)?  Yes  No (if yes, list in Section C.2.j)
  - c. Is the waste subject to RCRA Subpart CC Controls-(40 CFR 264.1083 & 265.1084)?  Yes  No  ? Click for Add'l Info
    - If no, does the waste meet the organic LDR Exemption?  Yes  No
    - If no, does the waste contain <500 ppm volatile organic (VOC's)?  Yes  No
    - Volatile organic concentration \_\_\_\_\_ ppm
  - d. Is the waste predominately debris subject to the Alternate Debris Standards (40 CFR 268.45)?  Yes  No
  - e. Is the waste predominately soil subject to the Alternate Soil Treatment Standards-(40 CFR 268.49)?  Yes  No
    - If yes, will Underlying Hazardous Constituents apply? (list in C.2.j)  Yes  No
  - f. Does the waste represented by this profile contain asbestos?  Yes  No
    - If yes,  Friable  Non-Friable
  - g. Does the waste represented by this profile contain benzene?  Yes  No
    - Is this subject to Benzene Operations Waste NESHAP (40 CFR Part 61 Subpart FF)?  Yes  No
    - If yes, complete Benzene Waste Operations NESHAP (BWON) questionnaire

Containers # 11-18

# Generator's Hazardous Waste Profile Sheet

Profile Number

### C. Waste Stream Information (continued)

- h. Is this profile for remediation waste from a facility that is a major source of Hazardous Air Pollutants (Site Remediation NESHAP, 40 CFR 63 subpart GGGGG)?  Yes  No  
If yes, does the waste contain <500 ppm VOHAPs at the point of determination?  Yes  No
- i. Does the waste represented by this waste profile sheet contain concentrations of Polychlorinated Biphenyls (PCBs) regulated by 40 CFR 761? (if yes, list in Chemical Composition - C.2.j)  Yes  No  
Were the PCBs imported into the U.S.?  Yes  No  
Are PCBs regulated under the "Self-Implementing Remediation Section of (Mega) Rule?" 40CFR 761.61(a)  Yes  No
- j. Chemical Composition (List all constituents [including halogenated organics, debris, and UHC's] present in any concentration and submit representative analysis):  (See Attached - for entering additional constituents)

Constituents (Total Composition Must be > 100%)	Lower Range	Unit of Measure	Upper Range	Unit of Measure
1. Oil Spill Clean-Up Materials w/ Asbestos Fibers	99	%	>99	%
2. Trace Metals ( See Analysis )	0	%	<100PPM	%
3.				
4.				
5.				
6.				

- k. Check any that apply:  Pyrophoric  Water Reactive  OSHA Carcinogen  Shock Sensitive  Oxidizer  Infectious
- l. Is the waste subject to controls as a Group 1 wastewater or residual under the Hazardous Organic NESHAP?  Yes  No  
If yes, is it a Table 8 \_\_\_\_\_ or Table 9 \_\_\_\_\_ compound?
- m. Does the waste represented by this waste profile sheet contain radioactive material?  Yes  No  
Is disposal regulated by the Nuclear Regulatory Commission?  Yes  No  
If NORM, identify isotopes and concentration, \_\_\_\_\_ pCi/g
- n. Is the waste from a CERCLA (40 CFR 300, Appendix B) or state mandated clean-up?  Yes  No  
If yes, attach Record of Decision (ROD), 104/106 or 122 order or court order that governs site clean-up for activity.  
For state mandated clean-up, provide relevant documentation.
- o. Is this a State Hazardous Waste?  Yes  No If yes, please list applicable codes \_\_\_\_\_  
If NY waste codes B001-B007 apply, please complete question C.2.c on page 1.

### D. DOT Information and Shipping Volume

- 1. Quantity of Waste
  - a.  Event  Base/Ongoing (check one)
  - b. Estimated Annual Quantity: 8 X 55DM  Tons  Yards  Drums  Other (specify) \_\_\_\_\_
  - c. Shipping Frequency: Units: \_\_\_\_\_ Per:  Month  Quarter  Year  One Time  Other \_\_\_\_\_
- 2. Shipping Information
  - a. Packaging:
    - Roll off/End dump: \_\_\_\_\_  Other: \_\_\_\_\_
    - Drum Type/Size: 1A2 - 55Gallon  Vacuum Box
    - Tanker  Super Sack  Tote Bin  Cubic Yard Boxes
  - b. Is this a U.S. Department of Transportation (USDOT) Hazardous Material? (If no, skip c, d and e)  Yes  No
  - c. Reportable Quantity (lbs.; kgs.): 10lbs d. Primary/Subsidiary Hazard Class(es)/ID#: 9 NA3077
  - e. USDOT Shipping Name: RQ Hazardous Waste, Solid, n.o.s. ( Contains Lead, Arsenic ) PG: III

### E. Generator Certification (Please read and certify by signature below)

I hereby certify that all information submitted in this and all attached documents contain true and accurate descriptions of this wastestream. Any sample submitted is representative as defined in 40 CFR 261 - Appendix 1 or by using an equivalent method. I authorize WMI to obtain a sample from any waste shipment for purposes of recertification. If this certification is made by a broker, the undersigned signs as authorized agent of the generator and has confirmed the information contained in this Profile Sheet from information provided by the generator and additional information as it has determined to be reasonably necessary. If approved for management, Contractor has all the necessary permits and licenses for the waste that has been characterized and identified by this approved profile. All relevant information within the possession of the Generator regarding known or suspected hazards pertaining to the waste will be disclosed to the contractor. All changes which occur in the character of the waste will be identified by the Generator and be disclosed to the Contractor prior to providing the waste to the Contractor.

# Generator's Hazardous Waste Profile Sheet

Profile Number

## C. Waste Stream Information (continued)

- h. Is this profile for remediation waste from a facility that is a major source of Hazardous Air Pollutants (Site Remediation NESHAP, 40 CFR 63 subpart GGGGG)?  Yes  No  
 If yes, does the waste contain <500 ppm VOHAPs at the point of determination?  Yes  No
- i. Does the waste represented by this waste profile sheet contain concentrations of Polychlorinated Biphenyls (PCBs) regulated by 40 CFR 761? (if yes, list in Chemical Composition - C.2.j)  Yes  No  
 Were the PCBs imported into the U.S.?  Yes  No  
 Are PCBs regulated under the "Self-Implementing Remediation Section of (Mega) Rule?" 40CFR 761.61(a)  Yes  No
- j. Chemical Composition (List all constituents [including halogenated organics, debris, and UHC's] present in any concentration and submit representative analysis):  (See Attached - for entering additional constituents)

Constituents (Total Composition Must be > 100%)	Lower Range	Unit of Measure	Upper Range	Unit of Measure
1. Oil Spill Clean-Up Materials w/ Asbestos Fibers	99	%	>99	%
2. Trace Metals (See Analysis)	0	%	<100PPM	%
3.				
4.				
5.				
6.				

- k. Check any that apply:  Pyrophoric  Water Reactive  OSHA Carcinogen  Shock Sensitive  Oxidizer  Infectious
- l. Is the waste subject to controls as a Group 1 wastewater or residual under the Hazardous Organic NESHAP?  Yes  No  
 If yes, is it a Table 8 \_\_\_\_\_ or Table 9 \_\_\_\_\_ compound?
- m. Does the waste represented by this waste profile sheet contain radioactive material?  Yes  No  
 Is disposal regulated by the Nuclear Regulatory Commission?  Yes  No  
 If NORM, identify isotopes and concentration, \_\_\_\_\_ pCi/g
- n. Is the waste from a CERCLA (40 CFR 300, Appendix B) or state mandated clean-up?  Yes  No  
 If yes, attach Record of Decision (ROD), 104/106 or 122 order or court order that governs site clean-up for activity.  
 For state mandated clean-up, provide relevant documentation.
- o. Is this a State Hazardous Waste?  Yes  No If yes, please list applicable codes \_\_\_\_\_  
 If NY waste codes B001-B007 apply, please complete question C.2.c on page 1.

## D. DOT Information and Shipping Volume

1. Quantity of Waste
- a.  Event  Base/Ongoing (check one)
- b. Estimated Annual Quantity: 8 X 55DM  Tons  Yards  Drums  Other (specify) \_\_\_\_\_
- c. Shipping Frequency: Units: \_\_\_\_\_ Per:  Month  Quarter  Year  One Time  Other \_\_\_\_\_
2. Shipping Information
- a. Packaging:
- Roll off/End dump: \_\_\_\_\_  Other: \_\_\_\_\_
- Drum Type/Size: 1A2 - 55Gallon  Vacuum Box
- Tanker  Super Sack  Tote Bin  Cubic Yard Boxes
- b. Is this a U.S. Department of Transportation (USDOT) Hazardous Material? (If no, skip c, d and e)  Yes  No
- c. Reportable Quantity (lbs.; kgs.): 10lbs d. Primary/Subsidiary Hazard Class(es)/ID#: 9 NA3077
- e. USDOT Shipping Name: RQ Hazardous Waste, Solid, n.o.s. (Contains Lead, Arsenic) PG: III

## E. Generator Certification (Please read and certify by signature below)

I hereby certify that all information submitted in this and all attached documents contain true and accurate descriptions of this wastestream. Any sample submitted is representative as defined in 40 CFR 261 - Appendix 1 or by using an equivalent method. I authorize WMI to obtain a sample from any waste shipment for purposes of recertification. If this certification is made by a broker, the undersigned signs as authorized agent of the generator and has confirmed the information contained in this Profile Sheet from information provided by the generator and additional information as it has determined to be reasonably necessary. If approved for management, Contractor has all the necessary permits and licenses for the waste that has been characterized and identified by this approved profile. All relevant information within the possession of the Generator regarding known or suspected hazards pertaining to the waste will be disclosed to the contractor. All changes which occur in the character of the waste will be identified by the Generator and be disclosed to the Contractor prior to providing the waste to the Contractor.

**3. MANIFEST MAIL ADDRESS (If different from generator)**

Contact Name Anne Spaulding  
Company Name City of Rochester  
Address 30 Church St. - City Hall - Room 300-B  
City, State, Zip Rochester, NY 14614

4. Generator SIC Code If 3312, do you perform Coke Oven Byproduct Recovery Operations? Yes  No  If 28 \_\_, 2911, 3312, or 4953, what is the Total Annual Benzene (TAB) in Megagrams/year?

5. Common Name Waste Oil c/w Lead

6. Process Generating Waste Discarding of Material During Facility Demolition

7. DOT Description \* (if available)  
RQ Hazardous Waste, Liquids, n.o.s. ( Contains Lead) 9 UN3082 III ( D008 )

8. Identify US EPA waste codes D008

9. If D001-D043, are any Underlying Hazardous Constituents (UHCs) present? Yes  No  NA  If yes, list in Section 13.

10. If F001-F005, or F039, list the F-listed hazardous constituents in Section 13.

11. US EPA Form Code \* W206 US EPA Source Code \* G15

12. Identify state waste codes

13. Waste Composition: Using specific chemical names and/or descriptions of waste composition, list all constituents present in the wastestream, and identify those that are underlying hazardous constituents (UHCs), or F001-F005/F039 hazardous constituents. Attach available analysis or MSDSs. Total composition must equal or exceed 100%.

Constituents	Range	Units	UHC?	F-Listed?
Waste Oil c/w Lead	100	%	Yes <input type="checkbox"/>	Yes <input type="checkbox"/>
* See Analytical Attached			Yes <input type="checkbox"/>	Yes <input type="checkbox"/>
			Yes <input type="checkbox"/>	Yes <input type="checkbox"/>
			Yes <input type="checkbox"/>	Yes <input type="checkbox"/>
			Yes <input type="checkbox"/>	Yes <input type="checkbox"/>
			Yes <input type="checkbox"/>	Yes <input type="checkbox"/>

I hereby certify that I am an authorized agent of the generator, and warrant on behalf of the generator, that all information submitted herein and attached documentation contains true, accurate and complete descriptions of this material. Any sample submitted for analysis is representative of the material being offered for approval. All relevant information regarding known or suspected hazards in the possession of the generator has been disclosed. I will notify Heritage Environmental Services, LLC or Von Roll America, Inc. of any changes in generator status, any information on this form, or any information on the attachments. This certification and signature apply to this form, to all attachments checked in section 20, and to the land disposal restriction notification (LDR) generated from this information.

Signature \_\_\_\_\_ Printed Name \_\_\_\_\_ Date \_\_\_\_\_ Company \_\_\_\_\_

22. COMPLETE THIS SECTION FOR NON-HAZARDOUS MATERIAL BEING MANAGED TO A NON-HAZARDOUS PROCESS (EXAMPLE: SUBTITLE D LANDFILL or MASS-BURN)

22a. Does this waste exhibit the chemical characterization of an oxidizer? Yes  No

22b. Is this waste a listed waste? (U, P, K, or F codes) Yes  No

22c. This waste is not characteristically hazardous for D001-D043 based on attached lab data (mark LD), attached MSDS (mark MSDS), or generator knowledge (mark GK).

**RE: CITY OF ROCHESTER; 354 WHITNEY ST. MANIFEST**

Dear Greg,

Enclosed please find a revised manifest for the drum of petroleum sludge scheduled to be picked up by New York Environmental Technologies, Inc. (NYETECH) on March 3<sup>rd</sup>. Please have this manifest and waste profile signed and return to me no later than March 2<sup>nd</sup>. Our mailing address is PO Box 24398, Rochester, NY 14624.

Thank you in advance for your assistance. If you have any questions, feel free to contact me at 585.436.5660.

Very truly yours,

**NEW YORK ENVIRONMENTAL TECHNOLOGIES, INC.**

Re: Hazardous Waste Disposal/Pricing for City of Rochester Dept. of 354 Whitney Street Rochester  
NY 14604 (Generator # 710039)

Dear Amy Minister:

As directed by 40 CFR 261.12(b) and Cycle Chem, Inc.'s hazardous waste permit, Cycle Chem, Inc. hereby informs you that the waste streams referenced below have been granted pre-acceptance approval.

Cycle Chem, Inc. is permitted, is capable, has capacity and is willing to accept your waste, provided it conforms to the Material Profile Sheet upon which the pre-acceptance approval was granted.

This document is important. Please file it for safekeeping. A copy is also held at the Cycle Chem, Inc. facility.

**PETROLEUM SLUDGE HAZ FOR METALS**  
Pricing: [redacted] per 55 G DRUM

Seq. A Product-SMM

Terms: > 5% HALOGENS; > 5K BTU/LB; NO DEBRIS; < 15% WATER; < 500 LBS/55 DRUM; PH: 2.1 - 12.4; MONOLITHIC SOLIDS, SAND, STONE, DIRT, AND METAL OBJECTS; SUBJECT TO SURCHARGE. HIGH BTU SLUDGE/SOLID MATERIAL WHICH PASS THE BROOM STICK TEST, ARE SMM (ONE IS ABLE TO PUSH A BROOM STICK THROUGH THE PRODUCT AND HIT THE BOTTOM OF THE DRUM). IF A BROOM STICK IS UNABLE TO PASS THROUGH THE PRODUCT IT IS SSM. D001, 3-6, 10, 11, 15, 19, 21-23, 26, 27, 31, 35, 39, 40, F001-5 (D002, W/H, CODES)

Shipping Name: RO. HAZARDOUS WASTE, LIQUID, N.O.S. (LEAD)  
Class: 9 ID No. NA3082.79 III RO.  
USHA Haz Codes: D004, D005, D007, D008, D009, D010, D011

Ultimate Treatment: FUEL BLENDING  
Final Facility: CBOCYCLE, LLC

If you have any questions regarding this proposal, please contact your Technical Representative, Todd Meyer, at (717) 938-4700.

This quote shall be deemed made in the State of Pennsylvania and shall be interpreted under the laws of said State and the customer recognizes and consents to the jurisdiction over him/her/it of the courts of the State of Pennsylvania. This quote supersedes all prior communication and contains the entire agreement between the parties including all expressed or implied warranties. No alterations or modifications of the quote shall be valid unless in writing and signed by both parties to this quote. Payment terms are net 30 days.

Acceptance of Proposal - I have received and agree to the CCI terms and conditions. The rates, specifications and conditions are satisfactory and are hereby accepted. You are authorized to do the work as specified.

# ***TECHNICAL MEMORANDUM***

**TO:** City of Rochester, Department of Environmental Services  
City Hall, Room 300-B  
30 Church Street  
Rochester, New York 14614

**ATTN:** Jane Forbes  
Environmental Specialist

**FROM:** Roy Green, Lu Engineers  
Project Engineer

**DATE:** November 27, 2006

**RE:** Limited Lead Inspection  
354 Whitney Street  
Rochester, New York 14606  
Lu Project No. 4216

---

## ***INTRODUCTION***

Lu Engineers was contracted by the City of Rochester to provide a limited lead inspection of the 354 Whitney Street site. The structures located on the property require demolition to facilitate the Brownfield cleanup and site redevelopment.

The inspection included only a cursory assessment to determine if lead was present in dust or in painted surfaces. The limited lead inspection included only the above grade portions of the buildings and did not include the tunnels known to exist under the buildings.

## ***LEAD SAMPLING***

An EPA-certified Lead Risk Assessor from Lu Engineers conducted the limited inspection for this project on August 30, 2006. Several surfaces with damaged paint were sampled for lead content. In addition, lead dust wipe samples were collected from floor areas adjacent to damaged paint. A total of ten (10) lead paint chip samples and two (2) lead dust wipe samples were collected. In addition, one (1) lead dust wipe control sample was collected. The sample locations are indicated on the lead bulk sample location sketches included in Attachment A.

The samples were submitted to AMA Analytical Services, Inc., an ELAP-, NVLAP- and AIHA-certified laboratory. A copy of Lu Engineers' license and risk assessor certification, as well as AMA's laboratory credentials is included in Attachment B.

## LIMITATIONS

The sampling for the lead risk assessment was limited to twelve (12) total samples plus one (1) field blank. Not all building components with damaged painted surfaces were sampled for the presence of Lead. A comprehensive lead inspection was not conducted.

## RESULTS

The following table summarizes the lead sampling results:

<b>Sample #</b>	<b>Building Component / Location</b>	<b>Type of Sample</b>	<b>Results</b>
WH-LBP-1A	1 <sup>ST</sup> Floor, South East Column, A105	Paint Chip	0.19%
WH-LBP-2A	1 <sup>ST</sup> Floor, Middle East Wall, A105	Paint Chip	0.25%
<i>WH-LBP-3A</i>	<i>1<sup>ST</sup> Floor, East Side, A105, Floor</i>	<i>Dust Wipe</i>	<i>3,900 ug/ft<sup>2</sup></i>
WH-LBP-4A	1 <sup>ST</sup> Floor, North West Column, A105	Paint Chip	0.28%
WH-LBP-5A	1 <sup>ST</sup> Floor, West Wall, A115	Paint Chip	0.028%
<i>WH-LBP-6A</i>	<i>1<sup>ST</sup> Floor, West Door, A113</i>	<i>Paint Chip</i>	<i>1.7%</i>
<i>WH-LBP-7A</i>	<i>1<sup>ST</sup> Floor, South East Stair Support, A103</i>	<i>Paint Chip</i>	<i>2.8%</i>
<i>WH-LBP-8A</i>	<i>2<sup>ND</sup> Floor, South East Wall, South Mezzanine</i>	<i>Paint Chip</i>	<i>2.4%</i>
WH-LBP-9A	2 <sup>ND</sup> Floor, Middle West Wall, A201	Paint Chip	0.24%
<i>WH-LBP-10A</i>	<i>2<sup>ND</sup> Floor, North West Column, A201</i>	<i>Paint Chip</i>	<i>12%</i>
WH-LBP-11A	2 <sup>ND</sup> Floor, Ceiling Under Raised Wood Floor, North Mezzanine	Paint Chip	0.09%
<i>WH-LBP-12A</i>	<i>2<sup>ND</sup> Floor, Floor, North Mezzanine</i>	<i>Dust Wipe</i>	<i>2,600 ug/ft<sup>2</sup></i>
WH-LBP-13A	Field Blank	Blank	<12 ug/ft <sup>2</sup>

According to the United States Environmental Protection Agency (EPA), paint or other surface coating is considered lead based if the concentration of lead is equal or greater than 0.5% by weight.

Four (4) of the ten (10) paint chip samples collected are considered lead based paint per EPA standards. Any surface coating or building component not sampled for lead must be treated as a lead based paint.

According to the Occupational Safety and Health Administration (OSHA), lead means metallic lead, all inorganic lead compounds and organic soaps with any concentrations of lead. Therefore, all samples collected are considered lead containing per OSHA standards.

According to current EPA Standards (40 CFR Part 745) and HUD guidelines, the following are recognized lead dust hazard levels for child occupied facilities, target housing, and for renovation / rehabilitation projects that involve federal monies.

<b>Surface</b>	<b>Lead Dust Hazard Level</b>
Bare and Carpeted Floor Surfaces	< 40 $\mu\text{g}/\text{ft}^2$

Since this facility is not a child occupied facility, target housing, and is not a rehabilitation project involving federal monies, this lead dust hazard level is provided ONLY for comparison.

Both lead dust wipe samples had an extremely high level of lead dust, indicative of major lead paint deterioration and damage typical of the conditions for this site.

A copy of the lead certificate of analysis from AMA Analytical Services, Inc. and the chain of custody is included in Attachment C.

### **LEAD HAZARDS**

Due to the abandoned nature of the buildings on the site, all painted surfaces are significantly damaged creating a potential lead hazard for workers who would be tasked with asbestos abatement or demolition.

Photo identification sheets are included in Attachment D. These photos show the condition of the painted surfaces at the time of sampling.

### **RECOMMENDATIONS**

Since the buildings located on the site are scheduled for demolition, it is recommended that all demolition contractors follow OSHA Standard 29 CFR 1926.62 relating to lead.

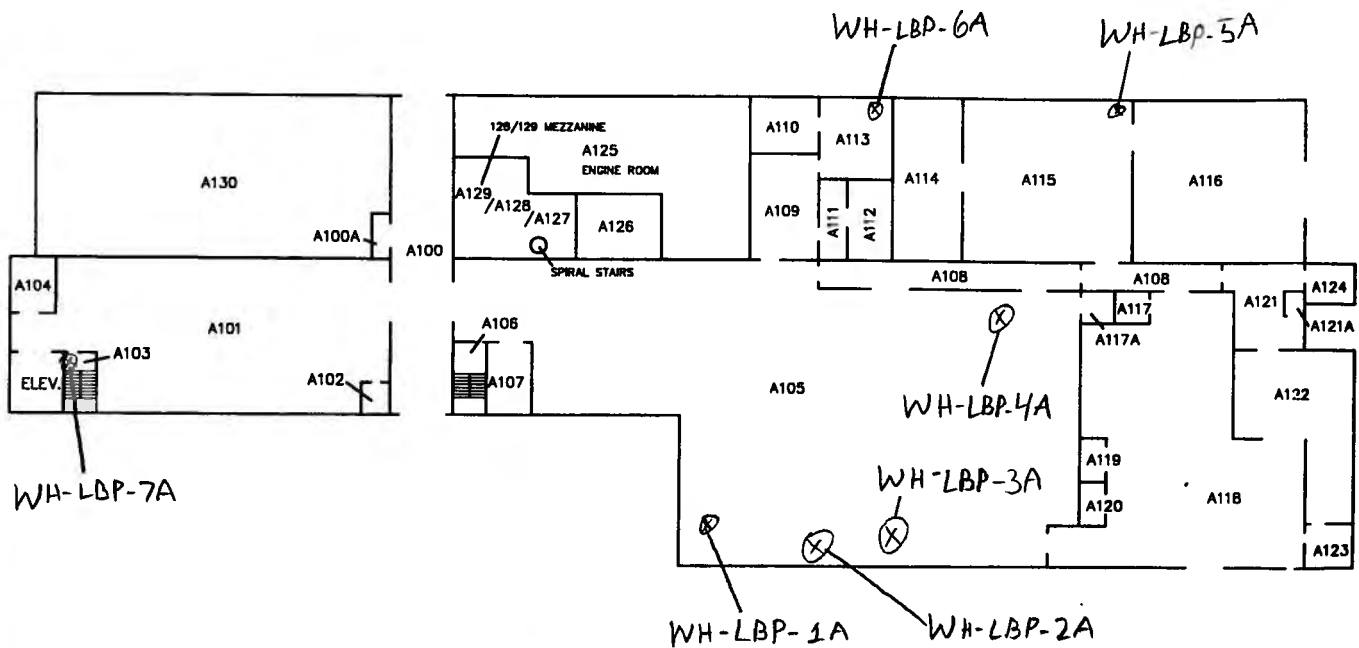

In addition, it is recommended that prior to disposal of any demolition wastes, Contractors should test the waste for toxicity in accordance with EPA Method 1311, Toxicity Characteristic Leaching Procedure (TCLP). If test results indicate a value greater than 5-mg/L, the demolition debris would be classified as a hazardous waste and should be disposed of accordingly.

Certificate Expiration Date: April 01, 2007

Dear Mr. Carney,

Enclosed are the ELAP and/or NELAP Certificate(s) of Approval issued to your environmental laboratory for the current permit year. The Certificate(s) supersede any previously issued and is(are) in effect through the expiration date listed above. Please carefully examine the Certificate(s) to insure that the categories, subcategories, analytes and methods for which your laboratory is approved are listed correctly, as well as verifying your laboratory's name, address, lead technical director and identification number.

Pursuant to regulation (Part 55-2 NYCRR), original certificates must be posted conspicuously in the laboratory and shall, upon request, be made available to any client of the laboratory. Certificates remain the property of the New York State Department of Health and must be surrendered promptly on demand.

Please note, pursuant to Section 55-2.5(a) NYCRR, any misrepresentation of the Fields of Accreditation (Matrix - Method - Analyte) for which your laboratory is approved may result in denial, suspension, or revocation of your certification. Any use of the ELAP or NELAP name, reference to the laboratory's approval status and/or using the NELAC/NELAP logo in any catalogs, advertising, business solicitations, proposals, quotations, laboratory analytical reports or other materials must include the laboratory's ELAP identification number, and must distinguish between proposed testing for which the laboratory is approved and the proposed testing for which the laboratory is not approved.

Please notify the ELAP office of any changes you feel need to be made to your Certificate(s). We may be reached via email to [elap@health.state.ny.us](mailto:elap@health.state.ny.us) or by calling (518) 485-5570.

Sincerely,

Joyce Reilly

**ATTN:** Jane Forbes  
Environmental Specialist

**FROM:** Roy Green, Lu Engineers  
Project Engineer

**DATE:** November 27, 2006

**RE:** Limited Lead Inspection  
415 Orchard Street  
Rochester, New York 14606  
Lu Project No. 4216

---

## **INTRODUCTION**

Lu Engineers was contracted by the City of Rochester to provide a limited lead inspection of the 415 Orchard Street site. The structures located on the property require demolition to facilitate the Brownfield cleanup and site redevelopment.

The inspection included the main 7-story building as well as the one-story addition and included only a cursory inspection to determine if lead was present in dust or in painted surfaces. The limited lead inspection included only the above grade portions of the buildings and did not include the tunnels known to exist under the buildings.

## **LEAD SAMPLING**

An EPA-certified Lead Risk Assessor from Lu Engineers conducted the limited inspection for this project on August 30, 2006. Several surfaces with damaged paint were sampled for lead content. In addition, one lead dust wipe sample was collected from floor adjacent to an area with damaged paint. A total of ten (10) lead paint chip samples and one (1) lead dust wipe sample were collected. In addition, one (1) lead dust wipe control sample was collected. The sample locations are indicated on the lead bulk sample location sketches included in Attachment A.

The samples were submitted to AMA Analytical Services, Inc., an ELAP-, NVLAP- and AIHA-certified laboratory. A copy of Lu Engineers' license and risk assessor certification, as well as AMA's laboratory credentials is included in Attachment B.

## LIMITATIONS

The sampling for the lead risk assessment was limited to eleven (11) total samples plus one (1) field blank. Not all building components with damaged painted surfaces were sampled for the presence of Lead. A comprehensive lead inspection was not conducted.

## RESULTS

The following table summarizes the lead sampling results:

<b>Sample #</b>	<b>Building Component / Location</b>	<b>Type of Sample</b>	<b>Results</b>
ORC-LBP-1A	1 <sup>ST</sup> Floor, East Stairwell, Wall	Paint Chip	0.085%
<i>ORC-LBP-2A</i>	<i>2<sup>ND</sup> Floor, Column By Elevator</i>	<i>Paint Chip</i>	<i>0.56%</i>
<i>ORC-LBP-3A</i>	<i>3<sup>RD</sup> Floor, SW Stairwell, Window Sill</i>	<i>Paint Chip</i>	<i>1.1%</i>
ORC-LBP-4A	4 <sup>TH</sup> Floor, East Wall, Column	Paint Chip	0.22%
ORC-LBP-5A	5 <sup>TH</sup> Floor, North Wall Center, Wall Behind Enclosure	Paint Chip	0.24%
ORC-LBP-6A	6 <sup>TH</sup> Floor, Above SE Elevator, Ceiling	Paint Chip	0.086%
<i>ORC-LBP-7A</i>	<i>7<sup>TH</sup> Floor, West Wall Window Frame</i>	<i>Paint Chip</i>	<i>0.67%</i>
<i>ORC-LBP-8A</i>	<i>1<sup>ST</sup> Floor, One Story Addition, Center Column</i>	<i>Paint Chip</i>	<i>6%</i>
<i>ORC-LBP-9A</i>	<i>1<sup>ST</sup> Floor, One Story Addition, Column</i>	<i>Paint Chip</i>	<i>1.2%</i>
ORC-LBP-10A	1 <sup>ST</sup> Floor, One Story Addition, Wall	Paint Chip	<0.011%
<i>ORC-LBP-11A</i>	<i>1<sup>ST</sup> Floor, One Story Addition, Floor</i>	<i>Dust Wipe</i>	<i>3200 ug/ft<sup>2</sup></i>
ORC-LBP-12A	Field Blank	Blank	<12 ug/ft <sup>2</sup>

According to the United States Environmental Protection Agency (EPA), paint or other surface coating is considered lead based if the concentration of lead is equal or greater than 0.5% by weight.

Five (5) of the ten (10) paint chip samples collected are considered lead based paint per EPA standards. Any surface coating or building component not sampled for lead must be treated as a lead based paint.

According to the Occupational Safety and Health Administration (OSHA), lead means metallic lead, all inorganic lead compounds and organic soaps with any concentrations of lead. Therefore, all paint samples collected are considered lead containing per OSHA standards.

According to current EPA Standards (40 CFR Part 745) and HUD guidelines, the following are recognized lead dust hazard levels for child occupied facilities, target housing, and for renovation / rehabilitation projects that involve federal monies.

<b>Surface</b>	<b>Lead Dust Hazard Level</b>
Bare and Carpeted Floor Surfaces	< 40 µg/ft <sup>2</sup>

Since this facility is not a child occupied facility, target housing, and is not a rehabilitation project involving federal monies, this lead dust hazard level is provided ONLY for comparison.

The lead dust wipe sample had an extremely high level of lead dust, indicative of major lead paint deterioration and damage typical of the conditions for this site.

A copy of the lead certificate of analysis from AMA Analytical Services, Inc. and the chain of custody is included in Attachment C.

### **LEAD HAZARDS**

Due to the abandoned nature of the buildings on the site, all painted surfaces are significantly damaged creating a potential lead hazard for workers who would be tasked with asbestos abatement or demolition.

Photo identification sheets are included in Attachment D. These photos show the condition of the painted surfaces at the time of sampling.

### **RECOMMENDATIONS**

Since the buildings located on the site are scheduled for demolition, it is recommended that all demolition contractors follow OSHA Standard 29 CFR 1926.62 relating to lead.

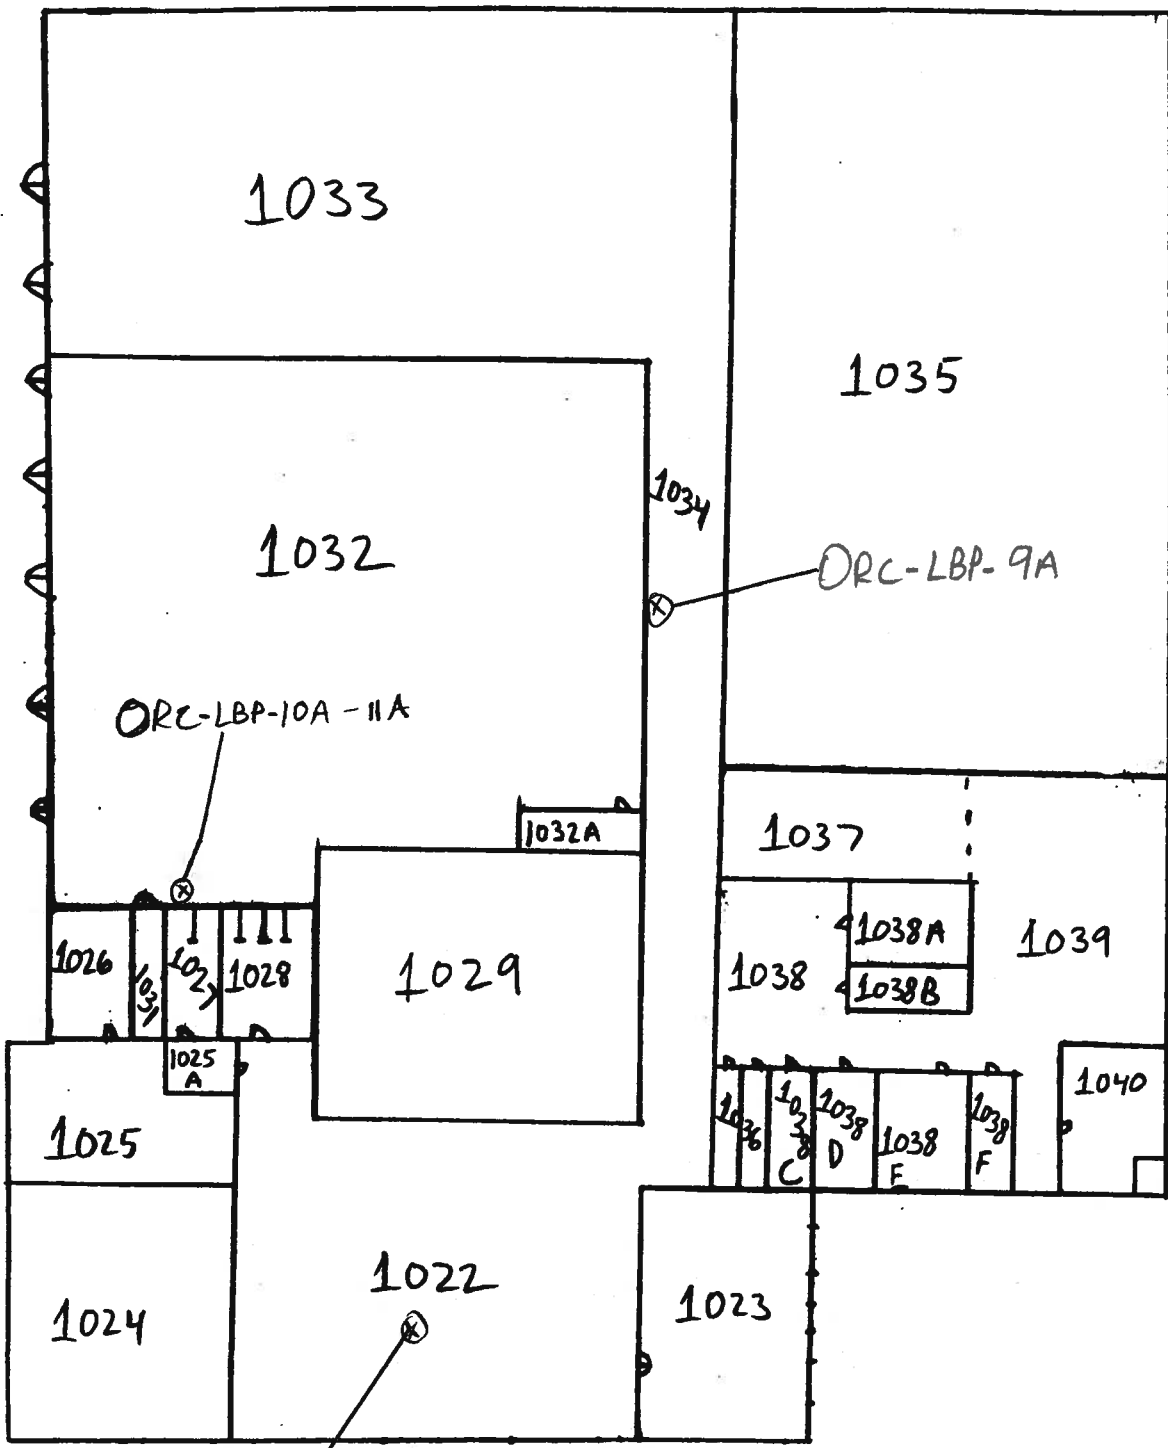

In addition, it is recommended that prior to disposal of any demolition wastes, Contractors should test the waste for toxicity in accordance with EPA Method 1311, Toxicity Characteristic Leaching Procedure (TCLP). If test results indicate a value greater than 5-mg/L, the demolition debris would be classified as a hazardous waste and should be disposed of accordingly.

MR. G EDWARD CARNEY  
AMA ANALYTICAL SERVICES INC  
4475 FORBES BLVD  
LANHAM, MD 20706

Certificate Expiration Date: April 01, 2007

Dear Mr. Carney,

Enclosed are the ELAP and/or NELAP Certificate(s) of Approval issued to your environmental laboratory for the current permit year. The Certificate(s) supersede any previously issued and is(are) in effect through the expiration date listed above. Please carefully examine the Certificate(s) to insure that the categories, subcategories, analytes and methods for which your laboratory is approved are listed correctly, as well as verifying your laboratory's name, address, lead technical director and identification number.

Pursuant to regulation (Part 55-2 NYCRR), original certificates must be posted conspicuously in the laboratory and shall, upon request, be made available to any client of the laboratory. Certificates remain the property of the New York State Department of Health and must be surrendered promptly on demand.

Please note, pursuant to Section 55-2.5(a) NYCRR, any misrepresentation of the Fields of Accreditation (Matrix - Method - Analyte) for which your laboratory is approved may result in denial, suspension, or revocation of your certification. Any use of the ELAP or NELAP name, reference to the laboratory's approval status and/or using the NELAC/NELAP logo in any catalogs, advertising, business solicitations, proposals, quotations, laboratory analytical reports or other materials must include the laboratory's ELAP identification number, and must distinguish between proposed testing for which the laboratory is approved and the proposed testing for which the laboratory is not approved.

Please notify the ELAP office of any changes you feel need to be made to your Certificate(s). We may be reached via email to [elap@health.state.ny.us](mailto:elap@health.state.ny.us) or by calling (518) 485-5570.

Sincerely,

Joyce Reilly

Program Administrator  
Environmental Laboratory  
Approval Program

**NEW YORK STATE DEPARTMENT OF HEALTH  
WADSWORTH CENTER**

*Antonia C. Novello, M.D., M.P.H., Dr.P.H.*

Expires 12:01 AM April 01, 2007  
Issued April 1, 2006

**CERTIFICATE OF APPROVAL FOR LABORATORY SERVICE**

*Issued in accordance with and pursuant to section 502 Public Health Law of New York State*

**MR. G EDWARD CARNEY  
AMA ANALYTICAL SERVICES INC  
4475 FORBES BLVD  
LANHAM, MD 20706**

**NY Lab Id No: 10920  
EPA Lab Code: MD00084**

*is hereby APPROVED as an Environmental Laboratory for the category  
ENVIRONMENTAL ANALYSES SOLID AND HAZARDOUS WASTE  
All approved subcategories and/or analytes are listed below:*

**Miscellaneous**

Asbestos in Friable Material	EPA 600/M4/82/020
Asbestos in Non-Friable Material-TEM	ITEM 198.4 OF MANUAL
Lead in Dust Wipes	EPA 7420
Lead in Paint	EPA 7420

**Serial No.: 29206**

Property of the New York State Department of Health. Valid only at the address shown. Must be conspicuously posted. Valid certificates have a raised seal. Continued accreditation depends on successful ongoing participation in the Program. Consumers are urged to call (518) 485-5570 to verify laboratory's accreditation status.

# The American Industrial Hygiene Association

## AMA Analytical Services, Inc.

4475 Forbes Boulevard, Lanham, MD 20706

Laboratory ID: 100470

has fulfilled the requirements of the AIHA Laboratory Quality Assurance Programs (LQAP), thereby, conforming to the ISO/IEC 17025 international standard, *General Requirements for the Competence of Testing and Calibration Laboratories*. The above named laboratory has been accredited by AIHA in the following:

### ACCREDITATION PROGRAMS

- ✓ INDUSTRIAL HYGIENE      Accreditation Expires: 07/01/2008
- ✓ ENVIRONMENTAL LEAD      Accreditation Expires: 07/01/2008
- ENVIRONMENTAL MICROBIOLOGY      Accreditation Expires:
- FOOD      Accreditation Expires:
- UNIQUE SCOPE      Accreditation Expires:

Specific categories of testing, within each Accreditation Program, for which the above named laboratory maintains accreditation is outlined on the attached Scope of Accreditation. Continued accreditation is contingent upon successful on-going compliance with LQAP requirements. This certificate is not valid without the attached Scope of Accreditation.

Larry S. Pierce, PhD, CIH  
Chairperson, Analytical Accreditation Board

Donna M. Doganiero, CIH  
President, AIHA

# ***TECHNICAL MEMORANDUM***

**TO:** City of Rochester, Department of Environmental Services  
City Hall, Room 300-B  
30 Church Street  
Rochester, New York 14614

**ATTN:** Jane Forbes  
Environmental Specialist

**FROM:** Roy Green, Lu Engineers  
Project Engineer

**DATE:** October 13, 2006

**RE:** Asbestos Pre-Demolition Survey  
415 Orchard Street  
Rochester, New York 14606  
Lu Project No. 4216

---

## ***INTRODUCTION***

Lu Engineers was contracted by the City of Rochester to provide an asbestos pre-demolition survey of the 415 Orchard Street Site. The asbestos pre-demolition survey included the main 7-story building as well as the one-story addition. The asbestos pre-demolition survey was limited to above grade portions of the buildings and did not include the tunnels known to exist under the buildings. These structures require demolition to facilitate the Brownfield Cleanup and Redevelopment of the site. A site plan is included in Attachment A.

The results of the asbestos pre-demolition survey are presented in this technical memorandum.

## ***PROJECT OVERVIEW***

Previous asbestos inspection reports and record plans were not available for review prior to conducting the survey. Lu Engineers conducted the survey in August 2006.

## ***ASBESTOS BULK SAMPLING***

29 CFR Part 1910 OSHA (Occupational Safety and Health Administration), 40 CFR 763 Subpart E (ASHERA-Asbestos Hazard Emergency Response Act) and NYSDOL (New York State Department of Labor Industrial) Code Rule 56 sampling protocols were followed.

Following the aforementioned sampling protocols, two hundred forty (240) total bulk samples were collected by a NYSDOL certified asbestos inspector from Lu Engineers. A copy of Lu Engineers' license and the inspector's certification can be found in Attachment B. The suspect asbestos materials were given a homogeneous material number based on the color and texture of the material. The homogeneous material numbers were used to describe the existing conditions of the rooms inspected, which are indicated on the room-by-room inspection forms included in Attachment C.

The sample identification number indicated on the bulk sample location sketches corresponds to the homogeneous material numbers located on the laboratory analytical report, the bulk sample logs and the chain of custody forms, which are all included in Attachment D.

Friable samples were analyzed using NYS ELAP Method 198.1 (Polarized Light Microscopy (PLM)). Non-friable organically bound (NOB) samples were analyzed using NYS ELAP Method 198.1 (PLM) and/or NYS ELAP Method 198.4 (Transmission Electron Microscopy (TEM)). LaBella Associates, P.C. Analytical Laboratory was the NYSDOH ELAP approved laboratory used for analysis. A copy of LaBella's credentials can be found in Attachment B.

### ***ASBESTOS RESULTS/FINDINGS***

As defined by the NYSDOL 12NYCRR 56, a sample is considered to be asbestos containing if it contains greater than 1% asbestos by weight based on laboratory analysis. Asbestos location sketches and pictures of each homogenous material sampled are included in Attachment E.

A list of Homogeneous Materials (HM) identified for the areas inspected is included below. A ***bold and italicized HM*** indicates that the material is positive for asbestos based on the sample results and will be impacted by the demolition.

### **HOMOGENEOUS MATERIALS**

<b>HM No.</b>	<b>Description</b>
1	White Drywall Wall
2	Red Brick Wall
3	Brown Mortar Associated W/ #2
4	Pink Fiberglass Wall Insulation W/ Silver Backing
<b>5</b>	<b><i>Tan 12" X 12" Cream Floor Tile W/ Brown Streaks</i></b>
6	Brown Mastic Associated W/ #5
7	Brown 4" Cove Base Molding
8	Tan Mastic Associated W/ #7
9	Hard Grey 1-Coat Ceiling & Wall Plaster
10	Black Tar Paper Vapor Barrier Located In Walls
11	Black Cloth Wire Insulation
12	Sticky White Interior Window Glazing On Old Metal Framed Windows
<b>13</b>	<b><i>Hard White Interior Window Glazing On Old Metal Framed Windows</i></b>
14	Hard Pink Interior Window Glazing On Old Metal Framed Windows
15	Wood Fire Door Core – White Friable
16	Salmon Colored Brick Walls
17	Grey Mortar Associated W/ #16
18	Red 6" X 6" Quarry Tile Floor (Bathrooms & Stairwells)

**HOMOGENEOUS MATERIALS**

<b>HM No.</b>	<b>Description</b>
19	Dark Grey Grout Associated W/ #18
<b>20</b>	<b><i>Grey Paper Backing On 1 X 2 Metal Pan Ceilings</i></b>
21	Off-White Insulation On 1 X 2 Metal Pan Ceilings
22	Tan Cloth Interior Door Gasket
23	Tan Fiberboard Flooring
<b>24</b>	<b><i>Tan Fibrous Peg Board</i></b>
25	White 2' X 4' Suspended Acoustical Ceiling Tile
26	Lt. Brown 5" Cove Base Molding
27	Dark Brown Mastic Associated W/ #26
28	Brown Adhesive Used To Glue Drywall Walls To Studs
<b>29</b>	<b><i>Black Skylight Glazing</i></b>
30	White 12" X 12" Acoustical Ceiling Tile
31	Brown Glue Pucks Associated W/ #30
<b>32</b>	<b><i>White Fibrous Pipe Insulation "Mag"</i></b>
<b>33</b>	<b><i>Grey Mud Fitting</i></b>
<b>34</b>	<b><i>Crème Cloth Pipe Covering</i></b>
35	Ceiling Drywall
36	Yellow Fiberglass Ceiling & Wall Insulation W/ Silver Backing
37	Grey Fibrous Wall Board
38	Black Fiberglass Interior Duct Insulation / Backing
39	Dark Brown 4" Cove Base Molding
40	Dark Brown Mastic Associated W/ #39
41	White 12" X 12" Fiberglass Acoustical Ceiling Tile
42	Dark Brown Glue Puck Associated W/ #41
43	Brown Fibrous Wall Board
44	White Drywall Wall Joint Compound
45	Crème Drywall Wall Tape
46	White Drywall Wall
47	Light Brown Adhesive Used To Glue Drywall Walls To Studs
<b>48</b>	<b><i>White Furnas Gaskets</i></b>
49	Black Flexible Duct Connector
50	Light Brown Adhesive Used To Glue Wood Paneling To Studs
<b>51</b>	<b><i>Black Panel Adhesive Used To Glue Wood Paneling To Studs</i></b>
<b>52</b>	<b><i>Brown Linoleum</i></b>
<b>53</b>	<b><i>Brown Mastic Associated W/ #52</i></b>
54	2' X 4' Yellow Fiberglass Suspended Acoustical Ceiling Tiles
55	White Hvac Duct Tape
<b>56</b>	<b><i>Cream Linoleum W/ Cream &amp; Tan Squares</i></b>
<b>57</b>	<b><i>Yellow Mastic Associated W/ #56</i></b>
58	Red 12" X 12" Vinyl Floor Tile
<b>59</b>	<b><i>Black Mastic Associated W/ #58</i></b>
<b>60</b>	<b><i>Tan 12" X 12" Vinyl Floor Tile (Sticky Back)</i></b>
61	Yellow Mastic Associated W/ #60
<b>62</b>	<b><i>White 12" X 12" Vinyl Floor Tile (Sticky Back)</i></b>
63	Yellow Mastic Associated W/ #62
64	Creosote Soaked 6" X 3" Wood Blocks (Sub-Flooring)
65	Tar Based Black Mortar Associated W/ #64
66	Green Cloth Flexible Duct Connector

## HOMOGENEOUS MATERIALS

HM No.	Description
67	Brown Duct Caulk On Seams
68	<b>Dark Brown Linoleum W/ Light Tan Specks</b>
69	<b>Grey Backing Paper Associated W/ #68</b>
70	Grey Paper On Elevator Roof
71	Black Expansion Joint (Between Concrete Floors)
72	Black Tar Paper Vapor Barrier On Concrete Floors
73	White Sparkly Joint Compound-Walls, Associated W/ #75
74	Cream Joint Tape-Walls, Associated W/ #75
75	White Drywall Walls
76	2" Grey Cove Base Molding
77	Tan Mastic Associated W/ #76
78	Red 3" X 5" Brick Floor Tile & Cove Base
79	Grey Mortar Associated W/ #78
80	Grey Set Bed Associated W/ #78
81	Tan Cove Mastic Associated W/ #78 (Used As A Cove Base)
82	<b>Tan Linoleum W/ Light Tan Specks</b>
83	Yellow Mastic Associated W/ #82
84	White Linoleum W/ Blue Specks
85	Brown Linoleum Backing Associated W/ #84
86	Black Exterior Tar Coating (Behind Brick Façade)
87	<b>Cream Exterior Frame Caulk (Frame Bottoms) Sporadic Windows</b>
88	<b>Black Tar Based Exterior Siding Coating (On Building Remnants)</b>
89	<b>Black Flashing Tar (Breezeway Between Orchard &amp; Whitney)</b>
90	<b>Black Caulk On Metal Plate (West Elevation)</b>
91	White Exterior Window Glazing
92	<b>Off-White Exterior Window Caulk</b>
93	Light Grey Interior Window Glazing
94	<b>Off-White Interior Window Glazing</b>
95	Off-White Exterior Door Frame Caulk
96	Cream Exterior Window Glazing
97	Black Foundation Waterproofing Tar On Floor Slab
98	<b>White Exterior Window Glazing</b>
99	<b>Black Tar Paper (Top Layer Core 1) – Roof Field 1/16" Thick</b>
100	<b>Black Tar Paper (2<sup>nd</sup> Layer Core 1) -- Roof Field 1/16" Thick</b>
101	Black Tar (3 <sup>rd</sup> Layer Core 1) -- Roof Field 1/8" Thick
102	Black Tar (4 <sup>th</sup> Layer Core 1) -- Roof Field 1/8" Thick
103	Black Tar (5 <sup>th</sup> Layer Core 1) -- Roof Field 1/8" Thick
104	Black Tar (6 <sup>th</sup> Layer Core 1) -- Roof Field 1/8" Thick (On Concrete Deck)
105	<b>Grey Parapet Wall Cap – Tar (6<sup>th</sup> Floor Roof Parapet Wall Cap/Joints)</b>
106	Brown Clay Parapet Cap (6 <sup>th</sup> Floor Roof Parapet Wall)
107	Black Parapet Wall Flashing Tar (6 <sup>th</sup> Floor Roof Parapet Wall)
108	<b>Black Tar / Paper Parapet Wall Flashing (6<sup>th</sup> Floor Roof)</b>
109	<b>White (Weathered Grey) Caulk Between Building Joints (6<sup>th</sup> Floor Roof)</b>
110	<b>Black Tar / Paper (Top Layer Core 2) – Roof Field ¼" Thick</b>
111	Black Tar / Paper (2 <sup>nd</sup> Layer Core 2) – Roof Field ¼" Thick
112	<b>Black Brittle Tar (3<sup>rd</sup> Layer Core 2) – Roof Field 1/16" Thick</b>
113	Black Felt Paper (4 <sup>th</sup> Layer Core 2) – Roof Field 1/16" Thick (On Concrete Deck)
114	<b>Grey Valve Gasket</b>

**HOMOGENEOUS MATERIALS**

<b>HM No.</b>	<b>Description</b>
115	<b>Black Fiberglass Impregnated Felt Paper (On Parapet Walls – Se 6<sup>th</sup> Floor Bur)</b>
116	<b>Black Parapet Wall Cap Tar (Se 6<sup>th</sup> Floor Bur, Parapet Wall Cap)</b>
117	Yellow Iso Board (1 <sup>st</sup> Layer Core3) – Rubber Roof Field
118	Brown Iso Board Paper (2 <sup>nd</sup> Layer Core 3)
119	Brown Felt Paper (3 <sup>rd</sup> Layer Core 3) (On Concrete Deck)

***LIMITATIONS***

There are suspect asbestos containing pipe insulation and mud fittings located in the tunnels that are known to exist in the tunnels located under the 415 Orchard Street Site. These tunnels are currently flooded and access is limited. Full inspection of the tunnels is currently not possible due to the extensive amount of flooding. As requested by the City of Rochester, the asbestos pre-demolition survey was limited to the above grade portion of the site and did not include the below grade tunnels.

Due to the abandoned and unsecured nature of the site, the conditions of the asbestos containing materials will most likely change with the passage of time. Localized asbestos debris indicated on the asbestos location sketches may become more widespread due to vandalism or deterioration.

***RECOMMENDATIONS***

The asbestos containing materials identified in this asbestos pre-demolition survey will be impacted by the proposed demolition.

It is recommended that all asbestos containing materials be removed from the building in accordance with State and Federal Regulations by a NYSDOL licensed asbestos abatement contractor.

In addition, some friable asbestos containing materials have a considerable amount of damage and there are localized areas of debris. This debris and associated contaminated elements must be abated prior to building demolition.

This license has been issued in accordance with applicable provisions of Article 30 of the Labor Law of New York State and of the New York State Codes, Rules and Regulations (12 NYCRR Part 56). It is subject to suspension or revocation for a (1) serious violation of state, federal or local laws with regard to the conduct of an asbestos project, or (2) demonstrated lack of responsibility in the conduct of any job involving asbestos or asbestos material.

This license is valid only for the contractor named above and this license or a photocopy must be prominently displayed at the asbestos project worksite. This license verifies that all persons employed by the licensee on an asbestos project in New York State have been issued an Asbestos Certificate, appropriate for the type of work they perform, by the New York State Department of Labor.

Re: LaBella Associates Asbestos Analytical Laboratory  
NY Lab ID No. 11184  
New 2004 NELAP Laboratory Accreditation

Dear Chris:

LaBella Associates, P.C. is proud to announce that our high quality **in-house environmental laboratory** has earned **NELAP accreditation** in asbestos analysis through our on-going participation in New York State's upgraded laboratory approval program, which is now an accrediting authority of the National Environmental Laboratory Accreditation Conference (NELAC). NELAC is a nationwide cooperative effort of the USEPA, State and other Federal agencies to establish and promote performance standards for the inspection and operation of environmental laboratories. The National Environmental Laboratory Accreditation Program (NELAP) is the program that implements the NELAC standards. Our NELAP accreditations are for PLM and PCM analysis as defined below:

- **Environmental analyses solid and hazardous waste – approved analysis for Asbestos in Friable Material and**
- **Environmental analyses air and emissions – approved analysis for Fibers.**

Earning these accreditations demonstrates our ability to consistently meet the highest technical and quality performance standards for the analysis of asbestos samples. Our conformance with these performance standards requires our on-going participation in inspection and sample proficiency programs that are equivalent to those in all participating laboratories across the country, whether they are commercial, state or federal. All NELAP laboratories are inspected to the same standards, use the same analytical methods, the same quality control procedures and are tested with the same or similar proficiency samples. Accreditation constitutes participation in a nationally recognized laboratory testing program as required by 29 CFR 1926.1101 section k(5) for the analysis of bulk samples.

We are excited about being able to serve you at an even higher level of assured accuracy and quality. Should you have any questions about our services or want to discuss your specific needs, feel free to contact me at 585.295.6241. Thank you for considering LaBella Associates for your environmental laboratory needs. We look forward to working with you!

Sincerely,

LABELLA ASSOCIATES, P.C.

Lab Supervisor: Math Smith Date: 8/31/06

ND - None Detected CELL-Cellulose JC - Joint Compound MIN - Mineral GLASS - Fiberglass <1 = Trace PLAS - Plaster  
 P - Friable PLM analytical result N - NOB PLM analytical result T - TEM analytical result  
 G-Gravimetric Matrix Reduction. Sample residue weight <1% of original sample weight, TEM not required.

\*"Polarized-light microscopy (PLM) is not consistently reliable in detecting asbestos in floor coverings and similar non-friable organically bound materials. Quantitative transmission electron microscopy (TEM) is currently the only method that can be used to determine if this material can be considered to be non-asbestos containing.

PLM = 1, NOB = 21, TEM = 8

## Appendix C – Test Pit Logs

---

**Test Pit Log**

**Project No.: 4216**

**Page 1 of 1**

**Test Pit: TP-01**

**Project Name: Orchard /Whitney RI/IRM**

**Client: City of Rochester**

**Dimensions: 20'x6'x10'**

**Weather: Sunny, 50°**

**Tech.:ERD/GLA**

**Date Started: 10/01/08**

**Completed: 10/01/08**

**Oper.: Nate**

**Sub-Contractor: Paragon Environmental**

**Equipment: 200 Series Komatsu**

Depth Below Surface (Ft.)	Sample Number	Depth of Sample	PID (ppm)	Soil & Rock Classifications/Remarks
2	TP-01B (waste)		0	
4	TP-01A (soil)		0	0-3' Concrete and sub base material Clay tile drainage "crock" found at 1' bgs containing black sandy sludge with strong odor - clean pipe attached oriented southward
6			15	3-6.5' bgs brown f-m sand and silt , moist w/ building demo fill. Groundwater observed - no sheen or odor Terminated test pit at 6.5' bgs
8			0	
10			0	
12			0	

Remarks: Waste materials from crock staged in 55-gallon drum and secured pending characterization and disposal.  
Bedrock not encountered.

**Test Pit Log**

**Project No.: 4216**

**Page 1 of 1**

**Test Pit: TP-02**

**Project Name: Orchard /Whitney RI/IRM**

**Client: City of Rochester**

**Dimensions: 20'x6'x10'**

**Weather: Sunny, 50°**

**Tech.:ERD/GLA**

**Date Started: 10/01/08**

**Completed: 10/01/08**

**Oper.: Nate**

**Sub-Contractor: Paragon Environmental**

**Equipment: 200 Series Komatsu**

Depth Below Surface (Ft.)	Sample Number	Depth of Sample	PID (ppm)	Soil & Rock Classifications/Remarks
2			0	0-2' Loose asphalt underlain by thin gravel layer Clay tile drainage "crock" found at 2' bgs , empty with no odor clean pipe attached oriented southward  3-5.5' bgs brown f-m sand and silt , moist w/ building demo fill. Groundwater not observed - no odor Terminated test pit at 5.5' bgs
4			0	
6	TP-02 (soil)		0	
8			0	
10			0	
12			0	

Remarks: Bedrock not encountered

**Test Pit Log**

**Project No.: 4216**

**Page 1 of 1**

**Test Pit: TP-03**

**Project Name: Orchard /Whitney RI/IRM**

**Client: City of Rochester**

**Dimensions: 20'x9'x10'**

**Weather: Sunny, 50°**

**Tech.:ERD/GLA**

**Date Started: 10/01/08**

**Completed: 10/01/08**

**Oper.: Nate**

**Sub-Contractor: Paragon Environmental**

**Equipment: 200 Series Komatsu**

Depth Below Surface (Ft.)	Sample Number	Depth of Sample	PID (ppm)	Soil & Rock Classifications/Remarks
2			0	Concrete and sub base to approximately 2.0' bgs Location looks like an abandoned hydraulic lift
4			0	Brown sand and gravel to 7.0' bgs
6			0	
8	TP-03A (Soil)		15	Sand and gravel soil stained and exhibits petroleum/solvent odor Soils wet at 7.5' bgs, odor and slight sheen noted.
10	TP-03B (oily mtl.)		0	Terminated test pit at 9.0' bgs
12			0	

Remarks: Bedrock not encountered.

**Test Pit Log**

**Project No.: 4216**

**Page 1 of 1**

**Test Pit: TP-04**

**Project Name: Orchard /Whitney RI/IRM**

**Client: City of Rochester**

**Dimensions: 20'x9'x10'**

**Weather: Sunny, 50°**

**Tech.:ERD/GLA**

**Date Started: 10/01/08**

**Completed: 10/01/08**

**Oper.: Nate**

**Sub-Contractor: Paragon Environmental**

**Equipment: 200 Series Komatsu**

Depth Below Surface (Ft.)	Sample Number	Depth of Sample	PID (ppm)	Soil & Rock Classifications/Remarks
2			0	
4			0	
6			0	Water present in concrete pit (former basement) at approximately 5.0' bgs, no odor, no sheen
8			15	Concrete floor of former engine room Concrete and gravel to approx 9.0' bgs
10	TP-04		0	Native soils below floor slab, saturated brown cmf sand and gravel
12	(soil)		0	Terminated TP at approximately 11.0' bgs

Remarks: Bedrock not encountered.

**Test Pit Log**

**Project No.: 4216**

**Page 1 of 1**

**Test Pit: TP-05**

**Project Name: Orchard /Whitney RI/IRM**

**Client: City of Rochester**

**Dimensions: 20'x9.5'x10'**

**Weather: Sunny, 50°**

**Tech.:ERD/GLA**

**Date Started: 10/01/08**

**Completed: 10/01/08**

**Oper.: Nate**

**Sub-Contractor: Paragon Environmental**

**Equipment: 200 Series Komatsu**

Depth Below Surface (Ft.)	Sample Number	Depth of Sample	PID (ppm)	Soil & Rock Classifications/Remarks
2			0	
4			0	0-3' Concrete and sub base material Clay tile drainage "crock" found at 1' bgs containing black sandy sludge with strong odor - pipe attached containing sludge removed all piping and containerized with TP-01 waste
6			0	
8	TP-05 (soil)		0	3-6.5' bgs brown f-m sand and silt, moist w/ building demo fill. Groundwater observed - no sheen or odor
10			0	Terminated boring on bedrock at 9.5' bgs
12			0	

Remarks: Waste materials from crock and pipe staged in 55-gallon drum and secured pending characterization and disposal.

**Test Pit Log**

**Project No.: 4216**

**Page 1 of 1**

**Test Pit: TP-06**

**Project Name: Orchard /Whitney RI/IRM**

**Client: City of Rochester**

**Dimensions: 20'x9.5'x10'**

**Weather: Sunny, 50°**

**Tech.:ERD/GLA**

**Date Started: 10/01/08**

**Completed: 10/01/08**

**Oper.: Nate**

**Sub-Contractor: Paragon Environmental**

**Equipment: 200 Series Komatsu**

Depth Below Surface (Ft.)	Sample Number	Depth of Sample	PID (ppm)	Soil & Rock Classifications/Remarks
2			0	
4	TP-06		28.5	0-3' Concrete and sub base material Moist fill material mixed with native sand and gravel soils Strong solvent odor noted at approximately 4.0' bgs No piping or crock observed, odor dissipated quickly.
6			0	
8			0	3-6.5' bgs brown f-m sand and silt, moist w/ building demo fill. Groundwater observed - no sheen or odor
10			0	Native brown sand and gravel soils underlain by thin till layer to 9.5' bgs Terminated boring on bedrock at 9.5' bgs
12			0	

Remarks:

**Test Pit Log**

Project No.: 4216

Page 1 of 1

Test Pit: TP-37

Project Name: Orchard /Whitney RI/IRM

Client: City of Rochester

Dimensions: 10'x4.5'x10.5'

Weather: Overcast, 35°

Tech.: ED

Date Started: 3/22/11

Completed: 3/22/11

Oper.:

Sub-Contractor: TREC Environmental

Equipment: JD 200C 1C

TP-37

Depth Below Surface (Ft.)	Sample Number	Depth of Sample	PID (ppm)	Soil & Rock Classifications/Remarks
2			0	0-1': Black sand/silt fill
4			0	
6			0	
8			0	1-7': Brown silt/sand
10			0	
12			0	7-10.5': Rose brown silty fm sand; trace clay; moist wet cobbles (rounded).

TP-37

Remarks: No evidence of contamination. Rock @ 10.5', groundwater @ 9'.

# Appendix D – Soil Boring Logs & Monitoring Well Diagrams

<b>LEGEND</b> S- SPLIT SPOON SOIL SAMPLE U- UNDISTURBED SOIL SAMPLE C- ROCK CORE SAMPLE	@ 25-29' spoon and drill rod saturated (at least 5' of water); Encounter bedrock @ approximately 29'; auger to refusal @ 30.5'; Rollerbit to 34'; construct 33-24' screen; sand to 23.4'
--------------------------------------------------------------------------------------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

GENERAL NOTES:

- Stratification Lines represent approximate boundary between soil types; transitions may be gradual.
- PID readings were taken directly on exposed soil in disposable sleeve, immediately following retrieval from boring.

2230 Penfield Road  
 Penfield, New York 14526  
 585.377.1450 Fax 585.377.1266

Project Name: Orchard-Whitney ERP  
 Well ID: MW-8  
 Logged by: \_\_\_\_\_

Development Date: 9/30/08  
 Installation Date: 9/23/08

Job # 4216  
 Start Time: \_\_\_\_\_  
 End Time: \_\_\_\_\_

Initial Depth to Water: 10.04'  
 Final Depth to Water: \_\_\_\_\_  
 Screen Length: \_\_\_\_\_  
 Well Volume: \_\_\_\_\_ gals  
 (2" diameter = 0.163 gallons per foot of depth, 4" diameter = 0.653 gallons per foot of depth)

Measurement Point: \_\_\_\_\_  
 Well Depth before: 16.66'  
 Well Depth after: \_\_\_\_\_  
 Sediment Depth Removed: \_\_\_\_\_

Well Diameter: \_\_\_\_\_  
 Well Integrity:  
 Cap \_\_\_\_\_  
 Casing \_\_\_\_\_  
 Locked \_\_\_\_\_  
 Collar \_\_\_\_\_

Protective casing stick-up: \_\_\_\_\_

Casing/Well difference: \_\_\_\_\_

## WATER QUALITY PARAMETERS

Time	Volume Purged (gals)	Purge Rate (gals/min)	Temp. (deg. C)	pH (units)	Dissolved O2 (mg/L)	Turbidity (NTU)	Cond. (mS/cm)	Comments
	5							Extremely turbid, no clarity
	7.5							Dry with bailer
	5							Slightly less turbid than with bailer
								Continuing to become less turbid, verly slight transparent

Type of Water Quality Meter: \_\_\_\_\_  
 Purge Observations: \_\_\_\_\_  
 Purge Water Containerized: \_\_\_\_\_

## EQUIPMENT DOCUMENTATION

- Submersible Pump
- PVC Bailer
- Surge Block
- Other \_\_\_\_\_

Approximate Recharge Rate: \_\_\_\_\_

Total Gallons Removed: 18.75

# Low Flow Groundwater Sampling Field Record

2230 Penfield Road  
Penfield, New York 14526  
585.377.1450 Fax 585.377.1266

Project Name Orchard-Whitney ERP

Job # 4216

Location ID MW-10

Field Sample ID OW-MW-10-13

Sampling Event # 1

Activity Time 9:00-10:30

Sample Time 10:10

Date 10/14/08

## SAMPLING NOTES

Initial Depth to Water 9.66 feet

Measurement Point top of PVC

Well Diameter 2

Final Depth to Water 11.10 feet

Well Depth 17.88 feet

Well Integrity:

Screen Length 10 feet

Pump Intake Depth \_\_\_\_\_

Cap X

Total Volume Purged 2.9 gallons

PID Well Head \_\_\_\_\_

Casing X

[purge volume (milliliters per minute) x time duration (minutes) x 0.00026 gal/milliliter]

Locked \_\_\_\_\_

Volume of Water in casing – 2” diameter = 0.163 gallons per foot of depth, 4” diameter = 0.653 gallons per foot of depth

Collar X

## PURGE DATA

Drawdown volume =  $0.2 \times 3 = 0.6$  gallons

Time	Depth to Water (ft)	Purge Rate (ml/min)	Temp. (deg. C)	pH (units)	Dissolved O2 (mg/L)	Turbidity (NTU)	Cond. (mS/cm)	Pump intake depth (ft)	Comments (ORP)
9:12	9.66	250						12	
9:17	10.00	250	18.1	7.1	9.81	10	1.50	13	69
9:20	10.20	250	18.1	7.2	9.89	10	1.53	13	67
9:25	10.35	250	18.0	7.2	9.53	4.8	1.57	13	7.5
9:30	10.51	250	17.9	7.3	9.12		1.58	13	87

10:00	10.90	250	17.9	7.3	7.50		1.36	13	95
10:05	10.96	250	17.9	7.3	7.37	7.1	1.37	13	95

Purge Observations: clear

Purge Water Containerized: no

## EQUIPMENT DOCUMENTATION

Type of Pump: Peristaltic-Geopump

Type of Tubing: polyethylene

Type of Water Quality Meter: Horiba U-22

Calibrated: \_\_\_\_\_

## ANALYTICAL PARAMETERS

Parameter Volumes Sample Collected

VOCs 3-40mL X

SVOCs 2-1L X

PCBs 2-1L X

Metals 1-8oz X

## LOCATION NOTES

Well drawing down, geopump will only pump @250 ml/min, lowest rate

Check drawdown volume, all other parameters stable.

Removed 3X drawdown volume West of Whitney Street and Site,

East of H&S Motors Used Cars

Signature: Rebecca May

# Low Flow Groundwater Sampling Field Record

2230 Penfield Road  
Penfield, New York 14526  
585.377.1450 Fax 585.377.1266

Project Name Orchard-Whitney ERP

Job # 4216

Location ID MW-18

Field Sample ID OW-MW-18-12

Sampling Event # 1

Activity Time 15:00-16:30

Sample Time 16:00

Date 10/8/08

## SAMPLING NOTES

Initial Depth to Water 6.63 feet

Measurement Point top of riser

Well Diameter 2

Final Depth to Water 6.64 feet

Well Depth 15.75 feet

Well Integrity:

Screen Length \_\_\_\_\_ feet

Pump Intake Depth \_\_\_\_\_

Cap X

Total Volume Purged 2.5 gallons

PID Well Head \_\_\_\_\_

Casing X

[purge volume (milliliters per minute) x time duration (minutes) x 0.00026 gal/milliliter]

Locked \_\_\_\_\_

Volume of Water in casing – 2” diameter = 0.163 gallons per foot of depth, 4” diameter = 0.653 gallons per foot of depth

Collar X

## PURGE DATA

Time	Depth to Water (ft)	Purge Rate (ml/min)	Temp. (deg. C)	pH (units)	Dissolved O2 (mg/L)	Turbidity (NTU)	Cond. (mS/cm)	ORP (mV)	Comments (ORP)

# Low Flow Groundwater Sampling Field Record

2230 Penfield Road  
Penfield, New York 14526  
585.377.1450 Fax 585.377.1266

Project Name Orchard/Whitney  
Location ID Orchard-MW-07  
Activity Time 13:41 - 15:23

Field Sample ID OW-MW-07-09  
Sample Time 15:04

Job # 4216  
Sampling Event # 2  
Date 3/9/09

### SAMPLING NOTES

Initial Depth to Water 6.83 feet  
Final Depth to Water 8.69 ~~4.69~~ feet  
Screen Length 10 feet  
Total Volume Purged 2.467 gallons  
Measurement Point TOR  
Well Depth 9.38 feet  
Pump Intake Depth 9  
PID Well Head -  
Well Diameter 2"  
Well Integrity:  
Cap   
Casing   
Locked   
Collar

[purge volume (milliliters per minute) x time duration (minutes) x 0.00026 gal/milliliter]

Volume of Water in casing - 2" diameter = 0.163 gallons per foot of depth, 4" diameter = 0.653 gallons per foot of depth

### PURGE DATA

Time	Depth to Water (ft)	Purge Rate (ml/min)	Temp. (deg. C)	pH (units)	Dissolved O2 (mg/L)	Turbidity (NTU)	Cond. (mS/cm)	ORP (mV)	Comments

# Low Flow Groundwater Sampling Field Record

2230 Penfield Road  
Penfield, New York 14526  
585.377.1450 Fax 585.377.1266

Project Name Orchard/Whitney  
Location ID MW-8  
Activity Time 12:11-13:59

Field Sample ID OW-MW-08-14  
Sample Time 13:23

Job # 4216  
Sampling Event # 2  
Date 3/10/09

### SAMPLING NOTES

Initial Depth to Water Did not Measure feet      Measurement Point TOR  
Final Depth to Water Did not measure feet      Well Depth 17.75 feet      Well Diameter 2"  
Screen Length 10 feet      Pump Intake Depth 14      Well Integrity:  
Total Volume Purged 1.716 gallons      PID Well Head -      Cap   
[purge volume (milliliters per minute) x time duration (minutes) x 0.00026 gal/milliliter]      Casing   
Volume of Water in casing - 2" diameter = 0.163 gallons per foot of depth, 4" diameter = 0.653 gallons per foot of depth      Locked   
Collar

### PURGE DATA

Time	Depth to Water (ft)	Purge Rate (ml/min)	Temp. (deg. C)	pH (units)	Dissolved O2 (mg/L)	Turbidity (NTU)	Cond. (mS/cm)	ORP (mV)	Comments
12:34	-	150	8.2	6.95	0.0		1.87	139	
12:39	-	150	8.2	6.92	0.0		1.80	132	
12:45	-	150	8.3	6.88	0.0		1.66	114	
12:51	-	150	8.4	6.89	0.0		1.60	107	
12:57	-	150	8.3	6.88	0.0	3.88	1.59	103	
13:03	-	150	8.3	6.89	0.0	2.68	1.53	95	
13:08	-	150	8.3	6.89	0.0	1.59	1.50	91	
13:13	-	150	8.2	6.88	0.0	0.44	1.49	88	
13:18	-	150	8.1	6.87	0.0	0.28	1.47	85	

Purge Observations: Top of river solid ice - could get tubing out, but not the H<sub>2</sub>O level monitor into well.  
Purge Water Containerized: No

### EQUIPMENT DOCUMENTATION

Type of Pump: Geopump  
Type of Tubing: Polyethylene  
Type of Water Quality Meter: Horiba U-22; LaMotte 2020

Calibrated: 3-9-09

# Low Flow Groundwater Sampling Field Record

2230 Penfield Road  
Penfield, New York 14526  
585.377.1450 Fax 585.377.1266

Project Name Orchard/Whitney  
Location ID MW-02  
Activity Time 11:50-1330

Field Sample ID OW-MW-02-13  
Sample Time 1:00

Job # 4216  
Sampling Event # 2  
Date 3/10/09

### SAMPLING NOTES

Initial Depth to Water 4.75 feet  
Final Depth to Water 4.90 feet  
Screen Length 12.0 feet  
Total Volume Purged 6.50/1.43 gallons  
Measurement Point TOR  
Well Depth 15.65 feet  
Pump Intake Depth \_\_\_\_\_  
PID Well Head \_\_\_\_\_  
Well Diameter 2"  
Well Integrity:  
Cap r  
Casing r  
Locked \_\_\_\_\_  
Collar r

[purge volume (milliliters per minute) x time duration (minutes) x 0.00026 gal/milliliter]

Volume of Water in casing - 2" diameter = 0.163 gallons per foot of depth, 4" diameter = 0.653 gallons per foot of depth

### PURGE DATA

Time	Depth to Water (ft)	Purge Rate (ml/min)	Temp. (deg. C)	pH (units)	Dissolved O2 (mg/L)	Turbidity (NTU)	Cond. (mS/cm)	ORP (mV)	Comments
12:15	4.85	200	6.4	7.17	7.04	3.39	1.20	205	0.26
12:20	4.80	150	6.2	7.28	7.13	2.51	1.25	203	0.195
12:25	4.80	125	5.9	7.34	7.05	3.69	1.26	200	
12:30	4.80	125	5.9	7.37	6.99	5.1	1.27	201	
12:35	4.80	105	5.9	7.38	6.96		1.27	201	
12:45	4.80	125	5.8	7.40	6.95	5.1	1.28	198	
12:50	4.80	125	5.9	7.42	7.00		1.25	198	
12:55	4.80	125	5.9	7.42	6.99	5.6	1.25	200	0.975

Purge Observations: Clear

Purge Water Containerized: \_\_\_\_\_

### EQUIPMENT DOCUMENTATION

Type of Pump: Geopump  
Type of Tubing: Polyethylene  
Type of Water Quality Meter: Horiba U-22; LaMotte 2020

Calibrated: 3-9-09

### ANALYTICAL PARAMETERS

Parameter	Volumes	Sample Collected
VOCs	3 x 40 ml	<input checked="" type="checkbox"/>
TAL Metals	1 x 250ml	<input checked="" type="checkbox"/>
SVOCs	1 x 1L	<input checked="" type="checkbox"/>
PCBs	1 x 1L	<input checked="" type="checkbox"/>
Extra	1 x 1L	<input checked="" type="checkbox"/>

# Low Flow Groundwater Sampling Field Record

Project Name Orchard/Whitney Job #4216-03  
 Location ID MW-14 Field Sample ID OW-GW-14 Sampling Event # ---  
 Activity Time 12:00 Sample Time 1:15 Date 9/22/11

### SAMPLING NOTES

Initial Depth to Water 9.04' feet Measurement Point TOR Well Diameter 2"  
 Final Depth to Water 13.48' feet Well Depth 13.98 feet Well Integrity:  
 Screen Length \_\_\_\_\_ feet Pump Intake Depth \_\_\_\_\_ Cap ok  
 Total Volume Purged \_\_\_\_\_ gallons PID Well Head 0.0 ppm Casing ok  
 [purge volume (milliliters per minute) x time duration (minutes) x 0.00026 gal/milliliter] Locked no  
 Volume of Water in casing - 2" diameter = 0.163 gallons per foot of depth, 4" diameter = 0.653 gallons per foot of depth Collar ok

### PURGE DATA

Time	Depth to Water (ft)	Purge Rate (ml/min)	Temp. (deg. C)	pH (units)	Dissolved O2 (mg/L)	Turbidity (NTU)	Cond. (mS/cm)	ORP (mV)	Comments
12:18	9.25	350	18.02	7.63	1.28	28	1,907	53.8	no odor
12:28	12.0	300	18.29	7.56	1.24	23	1,756	27.2	pump as slow as it will go
12:38	>13.68	300	17.63	7.45	2.49	110	2,508	2.7	well is pumping dry, can't slow pump down
1:15	sample								

Purge Observations: initial purge water high clarity  
 Purge Water Containerized: \_\_\_\_\_

### EQUIPMENT DOCUMENTATION

Type of Pump: Geopump  
 Type of Tubing: 3/8" HDPE  
 Type of Water Quality Meter: Horiba U-22; LaMotte 2020 Calibrated: \_\_\_\_\_

### ANALYTICAL PARAMETERS

Parameter Volumes Sample Collected  
 VOCs 2x 40 ml  
 RCRA Metals 1x 250  
 \_\_\_\_\_  
 \_\_\_\_\_  
 \_\_\_\_\_

### LOCATION NOTES

collected MS/MSD @ this location  
well pumped dry after 20 min @  
300 ml/min, slow as geopump would  
pump without stalling  
Turbidity > 50 upon sampling

REMEDIAL INVESTIGATION REPORT

NYSDEC ERP SITE#E828123

HYDROGEOLOGICAL CALCULATIONS

HYDRAULIC CONDUCTIVITY (K) VALUES\*

- MW-9: 0.000007084 ft/sec
- MW-10: 0.000003736 ft/sec
- MW-14: 0.00001195 ft/sec
- MW-20: 0.000008829 ft/sec
- MW-22: 0.00004179 ft/sec  
0.00007339 ft/sec

AVERAGE K (for 5 wells tested) =  $0.00007339/5 = 0.0000147$  ft/sec =  $1.47 \times 10^{-5}$  ft/sec

HYDRAULIC GRADIENT CALCULATION (March 2009 data)

- MW-9 to MW-19:  $512.18-504.89 = 7.29$  ft / 485 ft = 0.015 ft/ft  
(maximum gradient, southwest to northeast across Site)
- MW-9 to MW-22:  $512.18-504.15 = 8.03$  ft / 538 ft = 0.015 ft/ft  
(maximum gradient between two wells slug tested, southwest to northeast across Site)

GROUNDWATER VELOCITY CALCULATION

- $V = K \times I/n$
- MW-9 to MW-19:  $1.47 \times 10^{-5}$  ft/sec (0.015 ft/ft / 0.25) =  $8.82 \times 10^{-7}$  ft/sec = 0.076 ft/day  
(using average K for Site, northeast to southwest across Site)
- MW-9 to MW-22:  $2.44 \times 10^{-5}$  ft/sec (0.015 ft/ft / 0.25) =  $1.46 \times 10^{-6}$  ft/sec = 0.126 ft/day  
(using average K of MW-9 and MW-22 combined)

\* Hydraulic Conductivity (K) values were determined by using AQTESOLV for Windows Standard 3.5

# CERTIFICATIONS

I, Robert Hutteman, am currently a registered professional engineer licensed by the State of New York, I had primary direct responsibility for implementation of the remedial program activities, and I certify that the Interim Remedial Measures Work Plan was implemented and that all construction activities were completed in substantial conformance with the Department-approved Remedial Investigation and Interim Remedial Measures Work Plan.

I certify that all documents generated in support of this report have been submitted in accordance with the DER's electronic submission protocols and have been accepted by the Department.

I certify that all data generated in support of this report have been submitted in accordance with the Department's electronic data deliverable and have been accepted by the Department.

I certify that all information and statements in this certification form are true. I understand that a false statement made herein is punishable as a Class "A" misdemeanor, pursuant to Section 210.45 of the Penal Law. I, Robert Hutteman, of Lu Engineers at 175 Sully's Trail, Pittsford, New York am certifying as Owner's Designated Site Representative for the site.

# FINAL ENGINEERING REPORT

## 1.0 BACKGROUND AND SITE DESCRIPTION

The City of Rochester, Department of Environmental Services, Division of Environmental Quality (City) entered into a State Assistance Contract (SAC) with the New York State Department of Environmental Conservation (NYSDEC) in 2006, to investigate and remediate a 3.9-acre property located in the City of Rochester, New York.

The Site is located at 415 Orchard Street and 354 Whitney Street in the City of Rochester, Monroe County, New York and is identified as two parcels: Section 105.66 Block 3 Lots 23 and 24 on the City of Rochester Tax Map. The Site is situated on an approximately 3.9-acre area bounded by commercial buildings that front on Lyell Avenue to the north, a former railroad right-of-way to the south, Orchard Street to the east, and Whitney Street to the west (see Figure 1). The boundaries of the Site are fully described in Appendix A - Survey Map, Metes and Bounds.

Demolition of all structures on the 354 Whitney Street parcel was completed in 2008. The Whitney Street parcel is currently a fenced vacant lot covered primarily with concrete building slabs and building demolition debris. A large berm of brick, concrete, and building demolition debris is located on the western half of the southern edge of the Site. A smaller berm of similar material is also present along the western Site perimeter on Whitney Street.

A seven story brick and stone structure of approximately 371,600 square feet (ft) remains on the Orchard Street parcel (“High Rise”). The footprint of the 415 Orchard Street “High Rise” is in the process of being subdivided from the adjoining two parcels. The proposed subdivision is shown on the Site Survey Map (Appendix A). An adjacent, heavily dilapidated single-story structure on the 415 Orchard Street parcel (“Low Rise”) was demolished by the City in December 2009. Crushed masonry, brick, concrete and stone building demolition materials created during the demolition process are staged on-Site for future use during redevelopment.

The Site has undergone a series of environmental investigations since the late 1990s in order to assess Recognized Environmental Concerns at the Site. These investigations include:

- Draft Center City Industrial Park Facility Assessment, *Flint, Allen, White & Radley*, April 1999;
- United States Environmental Protection Agency (USEPA) Hazardous Substance Removal Action, 1999
- Phase I Environmental Site Assessment: 354 Whitney Street and 367, 370, 406, and 415 Orchard Streets, *Day Environmental, Inc.* December 2000;
- Pre-Demolition Asbestos Inspection of 354 Whitney Street Bldg 1A, *ENSR International*, August 2003;
- Pre-Demolition Asbestos Inspection of 354 Whitney Street Bldg 2/2A/ Brick Mill, *ENSR International*, August 2003; and
- Orchard-Whitney Targeted Site Assessment Report, *NYSDEC Region 8*, December 2006.

The presence of soil and groundwater contaminants at the Site was discovered as a result of environmental investigations by Flint, Allen, White & Radley, Day Environmental, Inc., and the NYSDEC. At the request of the NYSDEC, additional investigation work was conducted by Lu Engineers beginning in 2006 to define the nature and extent of accessible Site contamination. A comprehensive description of investigation work conducted by Lu Engineers' from 2006 to 2013 is provided in the *Site Investigation/Remedial Alternatives Report*, dated October 2013 and submitted under separate cover.

Previous environmental assessments and two phases of subsurface investigation conducted by Lu Engineers indicated the presence of contaminated soil and groundwater at the Site. The findings of the assessments and investigative work defined the nature and extent of contamination in the accessible areas of the Site, and identified a total of eight areas of concern (AOCs). The AOCs were identified as AOC-1 through AOC-8. The location of each AOC is illustrated on Figure 2. Investigation findings at three of the

eight AOCs warranted the execution of remedial efforts through a series of IRMs. A listing of the eight AOCs is provided below.

**AOC-1:** Underground Storage Tanks (USTs) (located on the west side of the 415 Orchard Street High-Rise)

**AOC-2:** Former Metal Plating Area (located immediately west of AOC-1)

**AOC-3:** Abandoned Hydraulic Lift (located in the north-central portion of the Whitney Street (open) parcel)

**AOC-4:** Former Gasoline Storage and Dispenser (located in the center of the Whitney Street Parcel)

**AOC-5:** Drain Systems (located beneath former buildings in the Whitney Street parcel)

**AOC-6:** Underground Tunnels and Buried Utilities

**AOC-7:** Former “Low-Rise” (footprint of former single-story building at 415 Orchard)

**AOC-8:** Former Coal Storage (located along southern Site perimeter)

A comprehensive description of each AOC is provided in the *Site Investigation/Remedial Alternatives Report*, dated January 2014 and submitted under separate cover.

An electronic copy of this Final Engineering Report (FER) with all supporting documentation is included as Appendix B.

## **2.0 SUMMARY OF SITE REMEDY**

### **2.1 Remedial Action Objectives**

The goal of the IRMs was to remove hazardous and non-hazardous materials that were considered to have the greatest potential for human exposure, as well as areas of known soil contamination, USTs, and an abandoned hydraulic vehicle lift that were potential contaminant sources to Site media.

Based on the results of the Remedial Investigation, the following Remedial Action Objectives (RAOs) were identified for this Site.

#### **2.1.1 Groundwater RAOs**

RAOs for Public Health Protection

- Prevent ingestion of groundwater containing contaminant levels exceeding drinking water standards.
- Prevent contact with, or inhalation of, volatiles emanating from contaminated groundwater.

RAOs for Environmental Protection

- Restore ground water aquifer, to the extent practicable, to pre-disposal/pre-release conditions.
- Prevent the discharge of contaminants to surface water.
- Remove the source of ground or surface water contamination.

#### **2.1.2 Soil RAOs**

RAOs for Public Health Protection

- Prevent ingestion/direct contact with contaminated soil.
- Prevent inhalation of or exposure to, contaminants volatilizing from contaminated soil.

## RAOs for Environmental Protection

- Prevent migration of contaminants that would result in groundwater or surface water contamination.

The City envisions future planned use of the Site to be for commercial purposes. Therefore, the NYSDEC SCOs reference in 6 New York Code of Rules and Regulations (NYCRR) Part 375 for Commercial Use and Protection of Groundwater will be used as guidance values for remediation at this Site.

## 2.2 Description of Selected Remedy

The *Site Investigation/Remedial Alternatives Report* provides a detailed evaluation of the remedial alternatives considered for the Site. The factors considered during the selection of the remedy are those listed in 6NYCRR 375-1.8. The following are the components of the selected remedy:

- IRM Removals;
- Institutional Controls;
- Engineering Controls; and
- Groundwater Monitoring.

This report details the completed IRM removals, which are one component of the final remedy. IRM removal areas were selected to address three areas of concern (AOC-1, AOC-2, and AOC-3) identified during the RI, as described below (see Figure 2 for respective locations of each IRM area).

AOC-1: USTs (located on the west side of the 415 Orchard Street High-Rise) included: removal and disposal of nine (9) USTs and 213.28 tons of associated non-hazardous petroleum-contaminated sand bedding material; 14.61 tons of hazardous lead-contaminated soil; 14,245 gallons of UST waste product; 1,100 gallons of UST cleanings and sludge; and treatment and on-Site disposal of 14,700 gallons of vault water.

AOC-2: Former Metal Plating Area (located immediately west of AOC-1); included excavation and disposal of a total of 127.05 tons of hazardous soil (Cr+6, Cd, As-

contaminated) and 533.65 tons of non-hazardous petroleum, Cr+6, cadmium, and arsenic-contaminated soil associated with the former metal plating area.

AOC-3: Abandoned Hydraulic Lift (located in the north-central portion of the 354 Whitney Street parcel); included removal and disposal of an abandoned hydraulic lift and approximately 5 tons of petroleum-impacted soil.

Figure 2 identifies the location of each IRM area. A complete discussion of work completed during each IRM is provided in Section 3.0.

### **3.0 DESCRIPTION OF INTERIM REMEDIAL MEASURES**

IRM removal activities completed at the Site were conducted in accordance with the NYSDEC-approved *Remedial Investigation and Interim Remedial Measures Work Plan*, dated April 2011, and the *Remedial Investigation and Interim Remedial Measures Work Plan Addendum*, dated April 2011, by Lu Engineers. Significant deviations from the work plan are noted in the sections below. A photo log of the work completed is included as Appendix B.

#### **3.1 AOC-1: UST Removal Activities**

The area identified as AOC-1 is located immediately adjacent to the west end of the 415 Orchard Street “High Rise” building, as illustrated on Figure 2. This initial phase of IRM work conducted in 2011 involved a detailed evaluation of AOC-1 followed by remedial actions, including the following tasks:

- Concrete slab demolition to facilitate UST system exposure
- UST waste product sampling, characterization and proper disposal
- Removal, inspection and disposal of nine USTs

##### **3.1.1 UST Evaluation**

The City of Rochester selected TREC Environmental, Inc. (TREC), through a public bidding process, to conduct UST evaluations, removals and disposal in AOC-1 (Figure 2). The UST evaluation and removal IRM was completed between April 14, 2011 and June 1, 2011 with oversight provided by Lu Engineers. Details of the UST evaluation are provided in the *Site Investigation/Remedial Alternatives Report*, dated December 2013.

Once TREC removed the one foot thick concrete cap from above the UST vaults, it was evident that the UST closure process required modification from the approach proposed in Section 3.2.6 of the approved Work Plan. It was concluded that the tanks were filled with sand in place. However, after the concrete cap was removed the sand was determined to be an insulating layer within the vault. Each UST was subsequently

opened and it was evident that the tanks contained product. The contents of each UST were sampled for waste characterization purposes to facilitate proper disposal. A summary of the details pertaining to each UST is presented in the following table.

**Table 1 – USTs**

TANK NUMBER	CAPACITY	CONTENTS	TYPE	LOCATION
1	1,600 Gallons	Fuel Oil Mix (full)	Single-Walled Steel	Sand Bedding Within Concrete Vault 1
2	1,600 Gallons	Fuel Oil Mix (full)	Single-Walled Steel	Sand Bedding Within Concrete Vault 1
3	1,600 Gallons	Fuel Oil Mix (full)	Single-Walled Steel	Sand Bedding Within Concrete Vault 1
4	1,600 Gallons	Gasoline (3/4 full with 3-4" Water)	Single-Walled Steel	Sand Bedding Within Concrete Vault 1
5	1,600 Gallons	Mineral Spirits (1/2 full, < 1" Product)	Single-Walled Steel	Sand Bedding Within Concrete Vault 1
6	700 Gallons +/-	Water (1/3 full, Water Only)	Single-Walled Steel	Sand Bedding Within Concrete Vault 2 (earthen floor)
7	1,100 Gallons +/-	Mineral Spirits (3/4 full)	Single-Walled Steel	Sand Bedding Within Stone & Mortar Vault 3
8	1,100 Gallons +/-	Mineral Spirits (3/4 full)	Single-Walled Steel	Sand Bedding Within Stone & Mortar Vault 3
9	10,000 Gallons	#2 Fuel Oil (3/4 full, < 1" Product)	Single-Walled Steel	Sand Bedding Within Concrete Vault 4, Covered by Reinforced Concrete

A total of eighteen (18) waste characterization samples were collected during IRM completed at AOC-1. Following completion of the waste product sampling in each UST, the tanks were temporarily covered with steel sheeting and concrete demolition debris to minimize potential safety hazards and the potential for contaminating site media while awaiting sample results. The revised remedial approach included the following steps:

- Exposure of re-covered tanks for access
- Removal and disposal of tank contents
- Removal of tanks and piping
- Removal of petroleum-contaminated sand bedding material
- Vault dewatering and inspection
- Vault backfilling

### **3.1.2 Tank Product Removal, Cleaning and Disposal**

On May 4, 2011 the UST vault system was uncovered to facilitate waste product disposal and to allow access for the tank cleaning and removal process. The demolished concrete material was set aside for possible re-use as backfill in areas of the site as-needed. Eggan Excavating and Equipment Company, Inc. (Eggan) mobilized an appropriately permitted vacuum truck to the site and removed waste product from USTs 1, 2, 3, 7, 8, and 9, totaling approximately 6,850 gallons. On May 5, 2011, the remainder of the product and sludge in each tank was removed by Eggan in two (2) vacuum trucks totaling approximately 7,395 gallons (1,175 gallons of gas/water from tank 4 and 6,220 gallons of fuel oil, mineral spirits & water from the remaining eight tanks). Table 1 indicates what type of waste product was contained within each tank.

The total volume of waste product liquids and sludge removed from the tanks prior to cleaning was 14,245 gallons. The non-hazardous waste product was transported to Industrial Oil Tank Service Tank Corp. in Oriskany, New York for proper disposal.

Following the waste product removal and disposal, TREC steam-cleaned the interior of the tanks with water to ensure they were suitable for proper removal and disposal. The tank cleaning process generated an additional 1,110 gallons of residual

tank sludge waste. On May 6, 2011, TREC hired NYETECH, Inc. who mobilized a vacuum truck to the Site to remove the tank cleaning waste liquid. NYETECH transported and disposed of the waste at Environmental & Industrial Contracting in Niagara Falls, New York. The total volume of tank waste product removed and disposed of, including tank cleaning fluids, was approximately 15,360 gallons. Waste disposal manifests from the product removal are included in Appendix C.

**3.1.3 Tank Bedding Material and Concrete Tank Vaults**

Figure 3 illustrates the layout of the UST vault system. Once the USTs were exposed it was evident that they were surrounded by and covered with sand bedding material. TREC partially removed the sand from the top and upper sides of the tanks to facilitate the tank removal process and staged the material on poly sheeting on the adjacent concrete slab (former plating area).

During the tank cleaning process rust holes were observed in several tanks which had leaked and subsequently impacted the surrounding sand bedding material. Elevated PID readings were observed during VOC monitoring of the removal and staging of the upper sand bedding material from each tank. At a depth of three (3) feet below the tops of tanks 1-5, the sand bedding material was discolored grey and had a strong petroleum-type odor. The following table presents the PID readings observed during the removal of the sand UST bedding material.

**Table 2 - AOC-1 PID Screening Results of Sand Bedding**

UST Vault	PID Readings (ppm)
Tanks 1 through 5	10 to 1,109
Tank 6	0 to 65
Tanks 7 and 8	0 to 46
Tank 9	0 to 180

Nine (9) USTs were contained within a series of four (4) concrete vaults. The overall footprint of the vault system was approximately 80 feet long by 12 feet wide (see Figure 3). The following is a summary of the interior vault dimensions and tanks formerly contained within each vault.

- Tank Vault 1: 33 feet long x 11.5 feet wide x 9 feet deep; contained Tanks 1-5; constructed entirely of concrete with steel I-beam reinforcement at grade
- Tank Vault 2: 4 feet long x 11.5 feet wide x 5 feet deep; contained Tank 6; constructed of combination of parged stone & mortar and concrete walls with earthen floor
- Tank Vault 3: 9.5 feet long x 11.5 feet wide x 8 feet deep; contained Tanks 7-8; constructed of parged stone & mortar
- Tank Vault 4: 31 feet long x 11.5 feet wide x 12 feet deep; contained Tank 9; constructed of parged stone & mortar

#### **3.1.4 Removal of Piping and Tanks**

On May 9, 2011, tank piping and associated connections were checked for the presence of petroleum and/or mineral spirits. 3-inch and 2-inch diameter pipes connected to Tank 9 were mounted to the west wall of the vault system and extended south through the wall of the Tank 1-5 vault. One-inch and ¾-inch diameter pipes were connected to the remaining tanks. With the exception of Tank 5, all tank-related piping was void of liquid contents, eliminating the need for vacuum extraction methods to be employed. Less than one gallon of petroleum product contained within the piping attached to the bottom of Tank 5 was drained into the already impacted sand bedding material at the time of removal. All piping and connections were evaluated and removed by non-sparking methods prior to any attempt to remove the tanks from the vaults. Air space within the vaults was continuously monitored for the presence of volatile organic vapors. Based on observed VOC and particulate air monitoring results being below the action levels established in the CAMP, a ventilation fan was not required to be used within the vault spaces.

On May 9, 2011, TREC used dry ice to inert each tank prior to removal. The atmosphere within each tank was checked with an explosimeter prior to continuing with the tank closure process. The City of Rochester Fire Marshall was on site to supervise the tank inerting and removal process. The orientation of each tank prior to removal is illustrated on Figure 3. Once the % O<sub>2</sub> and % LEL were observed within the acceptable range inside each tank, Tanks 1-6 were removed from the vaults and disposed of as scrap metal. On May 10, 2011 the remaining Tanks 7-9 were removed and disposed of as scrap metal. Each tank shell was carefully removed with a chain and excavator, inspected for holes, photographed and placed on a trailer for transport to Genesee Scrap and Tin Bailing, Inc. for recycling.

The following table summarizes the general tank conditions observed at the time of removal.

**Table 3 - UST Condition Summary**

Tank Number	Condition Upon Removal/Notes
1	Appeared free of rust holes, good condition
2	Appeared free of rust holes, good condition
3	Appeared free of rust holes, good condition
4	Several significant rust holes in tank bottom, poor condition
5	Appeared free of rust holes, good condition, 1" pipe attached to bottom
6	Several significant rust holes in tank bottom, poor condition
7	Several significant rust holes in tank bottom, poor condition
8	Appeared free of rust holes, good condition
9	Appeared free of rust holes, good condition

### **3.1.5 Tank Vault Dewatering, Treatment, and Disposal**

On May 16, 2011 NYETECH mobilized a vacuum truck to partially de-water the storm water that had collected within Vault 1 (Tanks 1-5) and combined storm water and ground water that had collected in Vault 4 (Tank 9). A total of 2,703 gallons of petroleum-impacted water was removed from the vaults and sent to the Industrial Oil Tank Service Tank Corp. in Oriskany, New York for disposal as a non-hazardous liquid. Disposal manifests are provided in Appendix D.

During the removal of the Tank 9 bedding material, an unknown pipe connection that penetrated the base of the common wall located between the north end of the tank 9 vault and the east-west oriented subsurface utility tunnel system, was damaged by the excavator bucket. The pipe, approximately 2-inches in diameter, was not visible during the removal of the last few buckets of sand bedding. Once damaged, water contained within the tunnel system infiltrated into the tank vault until the water levels equilibrated. Approximately 11,500 gallons of water infiltrated Tank 9.

Once the water level stabilized TREC placed a steel plate, oriented vertically, in front of the penetration and mobilized a concrete truck from Rochester Concrete & Block that poured 10 cubic yards of concrete between the plate and the northern vault wall, forming a permanent seal around the pipe penetration. Once the concrete cured, no further infiltration was observed from the tunnel.

To complete the dewatering process of the tank vaults, TREC mobilized a 21,000-gallon and an 8,000-gallon frac tank to the site. The remaining vault water, the majority of which was contained within the Tank 9 vault, was pumped into the 21,000 gallon tank, where it was sampled for waste characterization parameters. The Tank 9 vault water was found to contain hexavalent chromium above applicable standards. This was likely due to seepage of the impacted plating area groundwater through the western vault wall. The plating area groundwater contained hexavalent chromium contaminated water at levels above applicable standards. Once characterized, TREC treated the water on site by running it through two (2) 55-gallon activated carbon filtration drums. Once treated, it was temporarily transferred to the 8,000 gallon tank in stages for additional sampling and eventual discharge per the requirements of Monroe County Division of Pure Waters

(MCPW). Lu Engineers secured a sewer discharge permit from the MCPW to discharge the water to the City sewer system located on Orchard Street. Post-treatment water sample results were within the acceptable thresholds established by MCPW which allowed for discharge of the water. TREC initiated the discharge on June 9, 2011.

Following the initial dewatering by vacuum truck, the total volume of water removed from the vaults, treated and discharged on site was approximately 12,000 gallons, for an IRM total of approximately 14,700 gallons.

### **3.1.6 Soil and Tank Bedding Material Removal, Sampling and Disposal**

The sand tank bedding material was sampled from each of the four vaults and analyzed for the following waste characterization parameters to facilitate the disposal process:

- Toxicity Characteristic Leaching Procedure (TCLP) for benzene, toluene, ethylbenzene, and xylene (BTEX) VOCs EPA Method 8260B
- Flashpoint
- pH
- TCLP lead & chromium

The bedding material was removed from each vault and staged on 6-mil poly sheeting, pending waste characterization results and eventual disposal. The staging area was located immediately east of the Vault 4 (Tank 9) and constructed on a small berm that promoted drainage of any free liquid still contained in the bedding material back into the vault. During sand removal, tank cradles were uncovered from beneath each former tank location. The tanks were not strapped down and were held in place by the sand bedding material.

Waste characterization samples collected of the sand tank bedding material indicated that it was non-hazardous for the parameters tested. On May 20, 2011, TREC loaded a total of 213.28 tons of non-hazardous, petroleum contaminated vault sand bedding material into dump trucks. The material was transported and disposed of by

Silvarole Trucking, Inc. at the Mill Seat Landfill in Bergen, New York. Copies of the waste disposal manifests are provided in Appendix D.

The vaults had concrete or paved floors, with the exception of Vault 2 (Tank 6) which had an earthen floor. The Vault 2 (Tank 6) floor revealed grey staining, a petroleum-type odor, and elevated PID readings up to 500 ppm during soil removal. Petroleum-impacted soil was removed from the vault floor to a depth of approximately 9.5 feet bgs. The depth of 9.5 feet was the maximum reach of the mini-excavator that was used. The vault was too narrow for the width of the full-sized excavator bucket, thereby limiting the ability to remove additional impacted soil. The excavated soil was temporarily staged on poly sheeting and covered, pending waste characterization for the following parameters:

- TCLP BTEX VOCs (8260B)
- Flashpoint
- pH
- TCLP Lead and Chromium

The waste characterization sample failed TCLP for chromium and was determined to be a characteristic hazardous waste for disposal purposes. A total of 14.6 tons of hazardous soil from the Vault 2 (Tank 6) floor was loaded into an appropriately permitted truck and transported off-site by Price Trucking Corp. to CWM facility in Niagara Falls, New York. Copies of the waste disposal manifests are provided in Appendix D. Copies of the analytical results are included in Appendix E.

### **3.1.7 Vault Inspection**

Once all bedding material and water were removed, each vault was visually inspected for overall condition. The location and layout of the vault system is illustrated on Figure 3. The following is a list of the general conditions observed and details specific to each vault structure.

#### Vault 1 (Tanks 1-5):

- Appeared to be in good condition with no significant cracking or leaking in the walls or floor.

- Pipe penetrations:

A former 6"-diameter water line and former 3"-diameter fuel supply line (supplied 10,000 gal tank) which were cut off flush in the south wall of the vault. 6" pipe was 5.7 ft below ground surface (bgs) and 3" pipe was 1 ft bgs.; single 1"-diameter and 2"-diameter lines (connected to tank system) penetrated west wall of vault at north end, 1 ft bgs.

#### Vault 2 (Tank 6):

- Walls appeared to be in good condition with no visual cracking; west wall extended approximately 4 ft bgs where it ended and was underlain by soil; east side earthen floor with petroleum impacts (see Section 2.6 for details)

- Pipe penetrations:

6"-diameter water line penetrated earthen portion of west sidewall approx. 5 ft bgs (concrete portion of west wall extended 4 ft bgs) and east concrete sidewall at 5 ft bgs; same 3" former fuel supply line penetrated north & south sidewalls 1 ft bgs (pipe severed on either side of walls)

- A clay tile crock (approx. 8"-diameter) was mounted to east wall and was removed with the soil. A 4"-diameter clay tile line ran from crock through the east vault wall, approx. 2 ft bgs.

#### Vault 3 (Tanks 7-8):

- Appeared to be in excellent condition with no significant cracking or leaking in the walls or floor.
- Pipe penetrations: None

Vault 4 (Tank 9):

- Parged walls and floor appeared to be in good condition with no significant cracking; slow seep through west wall.

- Pipe penetrations:

A 4” pipe penetrated east wall (approx. 10 ft below grade), TREC plugged this pipe prior to backfilling. An approximate 2”-diameter pipe penetrated the north vault wall near the floor of the vault and connected to the utility tunnel system immediately north of the vault; this pipe was sealed with a large mass (10 cubic yards) of concrete. A utility plenum was located at the north end and top of west wall at 1 ft below grade.

**3.1.8 Tank Vault Backfilling and Restoration**

In an effort to minimize the potential for contaminant migration through groundwater from the plating area into any of the tank vaults, each vault was initially backfilled with flowable fill to approximately 5.5 to 6 feet below grade since the depth to static groundwater in the adjacent former plating area (AOC-2) was approximately 6.5 feet below grade. Thirteen (13) loads of flowable fill were placed in the vaults by a concrete truck, totaling 130 cubic yards. Once the flowable fill was placed, TREC backfilled the remaining vault void spaces to existing grade using a front-end loader and select uncontaminated fill materials from the berm located along the southwestern portion of the Site. Final grading of the backfill was accomplished using the front-end loader bucket.

Deviations from the RI and IRM Work Plan are summarized in the following table:

**Table 4 - AOC-1 Work Plan Deviations**

<b>Work Plan Section</b>	<b>Action in Work Plan</b>	<b>Revised Plan/Action</b>	<b>Justification</b>
3.2.6 – Underground Storage Tank Closures	Because it is assumed the USTs are filled with sand, USTs will be opened with a	USTs were found to contain free product and no sand; tank contents were removed,	Tank contents differed from what they were assumed to be thus warranting a different

Work Plan Section	Action in Work Plan	Revised Plan/Action	Justification
	“nibbler” or equivalent hydraulic cutting tool.	transported and disposed of by vacuum trucks. No cutting was necessary.	remedial approach.
3.2.6 – Underground Storage Tank Closures	Lu and City will obtain a variance for partial demolition of the tanks On-Site to facilitate access to tank contents for removal and disposal.	Acquiring a variance was not required.	Partial tank demolition was not necessary to access contents for removal and disposal.
3.2.6 – Underground Storage Tank Closures	Sand contained in USTs will be live-loaded into trucks for immediate transportation and off-Site disposal	Free product contained within each tank was sampled for waste characterization parameters, removed, transported and disposed of off-Site by vacuum trucks.	Upon being exposed, tanks were found to not contain sand.

### 3.2 AOC-2: Former Metal Plating Area Investigation and Soil Removal Activities

The AOC-2 IRM was conducted to eliminate potential sources of hazardous and non-hazardous subsurface soil and groundwater contamination associated with the former metal plating area (plating area), including petroleum contamination associated with the previously described former USTs. A detailed investigation of the plating area was conducted as described in the RI report. IRM activities were conducted in accordance with the approved *Remedial Investigation and Interim Remedial Measures Work Plan*.

A total of eighteen (18) waste characterization samples were collected as part of the remedial effort. Figure 4 illustrates all features associated with this AOC.

As previously described in Section 3.2.4, OPTECH, an appropriately qualified contractor, was contracted to conduct all excavation, remedial treatment and Site restoration activities under the direction of Lu Engineers and the City.

### **3.2.1 Plating Area Source Removal Background**

Initial soil and groundwater investigation conducted in 2008 in the vicinity of AOC-2 indicated the presence of high concentrations of hexavalent chromium (Cr+6) exceeding guidance and regulatory criteria by several orders of magnitude. The elevated chromium concentration in soil boring SB-19 (584 mg/kg) and elevated concentration observed in groundwater in MW-17 (32,300 ug/l) indicated the need for further delineation of the chromium levels in soil and groundwater in this area. It was concluded that unidentified, more highly contaminated soils in this area may have been acting as a source for the observed groundwater contamination. IRM efforts in 2008 and 2009 also indicated the likely presence of arsenic-contaminated soils in this portion of the Site.

In July 2011, a high-resolution soil boring program was completed within the plating area at the Site. Extensive sampling and testing confirmed the presence of soils which exceeded the NYSDEC Part 375 Restricted Commercial SCOs for arsenic, cadmium and chromium (16 ppm, 9.3 ppm, and 400 ppm, respectively), which required excavation and disposal. The goal of this IRM was to remove a sufficient volume of the arsenic, cadmium and chromium impacted soils identified during the investigation to meet the NYSDEC Part 375 Restricted Commercial Use criteria. NYSDEC also requested the evaluation of the Protection of Groundwater standard for Cr+6 (19 mg/kg) as a condition of the approval of the RI and IRM Work Plans.

The lateral extent of the former Plating Area is defined by concrete walls extending to various depths below grade. Only soil readily accessible by excavation equipment within the Plating Area was targeted for removal. Excavation work outside the footprint of the Plating Area was not conducted. Lu Engineers personnel provided assistance during excavation as necessary to verify that appropriate excavation depths were attained. The desired depths of excavation were based on investigation sample results and screening results from a Niton X-Ray Fluorescence (XRF) field instrument.

The ground surface in the former plating area was covered by a concrete slab. In order to allow access to the contaminated soils and to initiate soil removal, OPTECH removed the concrete plating area slab with a hoe-ram and excavator and staged the crushed concrete at the most southwest end of the plating area. This portion of the plating

area was not targeted for soil removal. Appropriate CAMP monitoring was conducted continuously during this task.

### **3.2.2 Soil Removal**

Data obtained during the detailed plating area evaluation was used to focus excavation activities on the areas and depths where the highest contaminant concentrations were identified. OPTECH initiated soil removal in the southeast corner of the plating area based on a 10-foot grid system. Soils exhibiting XRF readings exceeding 400 ppm (or equivalent) for chromium, 16 ppm for arsenic and 9.3 ppm for cadmium were removed and staged for waste characterization sampling, classification and eventual disposal.

During removal of source area soils, excavated materials and the excavation floor and sidewalls were examined for physical evidence of contamination including staining and odors, and screened with a PID and Niton XRF instrument for VOC and metal concentrations. Screening results were recorded on field logs. The excavation sidewalls and floor were screened consistently throughout the soil removal process to assist in appropriate segregation of staged soil piles prior to disposal. Laboratory waste characterization sample results from the staged soil piles were found to typically exhibit significantly lower contaminant concentrations than the XRF instrument screening concentrations observed and recorded in the field.

Soil was initially removed from east to west and then from south to north within the footprint of the plating area. A small rectangular area of soil in the eastern-central portion of the plating area was left in place, as indicated on Figure 4. This material was left intact based on field observations, including PID and XRF screening results, and confirmatory soil sample results (OW-PA-SWC-6 and OW-PA-SWC-12).

The targeted depths of excavation throughout the soil removal area footprint were based on the previously identified and interpolated contaminant concentrations plotted on grid-based mapping used in the field. The final dimensional area of the excavation measured approximately 67 feet long (south to north) by 35 feet wide (east to west). The vertical extent of contaminated soil requiring removal and off-site disposal varied

throughout the plating area but ranged between four (4) feet at the southern end and fourteen (14) feet below grade in the northeastern portion of the removal area. Soil types were variable, but included sand, silt and gravel with occasional clay lenses. Fill soils across the plating area extended from the ground surface to depths ranging between four (4) and eight (8) feet bgs. The fill soils were underlain by what appeared to be a native silt and clay horizon.

During soil removal in the vicinity of plating area wells PA-10 and PA-14, elevated PID readings, discolored soil and petroleum-type odors were observed. Elevated VOC concentrations were measured beginning at a depth of approximately five (5) feet. Initial PID readings reached 90 ppm at this depth. Soils in the northeastern half of the excavation exhibited elevated PID readings ranging from 25 to 325 ppm within the six (6) to twelve (12) foot bgs depth interval. Once the maximum depth of fourteen (14) feet was encountered, peak PID readings fell to 12.4 ppm and petroleum odors were faint. During soil removal in this area a light sheen was observed on the groundwater surface, but no free or measurable product was observed. It is noted that the western concrete wall of Vault 2 (Tank 6) extended five (5) feet bgs, the depth at which petroleum impacts in the Plating Area were initially observed.

Sub-slab piping and drainage structures were investigated and removed to the extent possible during the soil removal. An 8-inch diameter cast iron pipe was uncovered and removed from the center of the excavation at a depth of approximately 3.5 feet bgs. No waste contents or elevated PID readings were found within the pipe and it is unclear as to its former use. Seven ten-foot long sections of pipe were staged on the ground surface immediately west of the plating area. A six-inch diameter vitrified clay tile (VCT) pipe ran parallel to the cast iron pipe, approximately two feet east, and at the same approximate depth. This pipe featured two drainage crocks which were in-line with the pipe and filled with sediment at the time of discovery. The sediments were generally dark brown to black but also had a green-yellow discoloration to them. The crocks were sampled, temporarily placed in a 55-gallon drum and later added to the hazardous soil pile for disposal. These features are illustrated on Figure 4.

Several large blocks of concrete, measuring approximately four foot square, were uncovered on the west side of the plating area which were likely former support structures for large machinery. One block was visibly stained yellow-green, indicative of Cr<sup>+6</sup> contamination. OPTECH mobilized a small hoe-ram to the Site and broke the block into small pieces in order to determine the depth of penetration of impacts to the concrete. The block was significantly pulverized before the staining was no longer apparent. The concrete was sampled (OW-PA-Concrete-1) and found to be below Commercial SCOs for hazardous waste levels of metals contaminants. The stained portion of the broken concrete was disposed of with the non-hazardous soil.

### 3.2.3 Soil Pile Staging, Sampling and Disposal

Excavated soils that met Commercial Use SCOs as identified by XRF field screening results were stockpiled on poly sheeting east of the plating area. Soils were sampled for waste characterization to determine final disposition. Soils meeting Commercial Use SCOs were reused as backfill material within the excavation. Soils exhibiting evidence of contamination (XRF readings >400 ppm for chromium and >16 ppm for arsenic) were excavated and staged in eleven (11) separate piles on poly sheeting in a designated area of the site. Soil piles were segregated based on the depth of soil removal, generally in two foot vertical increments (0-2', 2-4', etc.). The following table summarizes the analytical parameters that each soil pile was tested for to determine the waste classification (hazardous or non-hazardous), for disposal. Analytical data is provided in Appendix D of this report.

**Table 5 - AOC-2 Waste Characterization Results**

<b>SOIL PILE / WASTE SAMPLE I.D.</b>	<b>ANALYTICAL PARAMETERS TESTED</b>	<b>HAZARDOUS OR NON- HAZARDOUS RESULTS</b>
Soil Pile 1A	RCRA metals, TCLP Cd	NON-HAZARDOUS
Soil Pile 1B	RCRA metals	NON-HAZARDOUS
Soil Pile 2	RCRA metals, TCLP Cd	NON-HAZARDOUS
Soil Pile 3A	RCRA metals, TCLP Cr	HAZARDOUS (for Cr <sup>+6</sup> )
Soil Pile 3B	RCRA metals	NON-HAZARDOUS
Soil Pile 4	RCRA metals, TCLP As & Cd, Cr	HAZARDOUS (for Cd)
Soil Pile 5	RCRA metals, TCLP Cd, Cr	NON-HAZARDOUS

<b>SOIL PILE / WASTE SAMPLE I.D.</b>	<b>ANALYTICAL PARAMETERS TESTED</b>	<b>HAZARDOUS OR NON- HAZARDOUS RESULTS</b>
Soil Pile 6	RCRA metals, TCLP Cr	NON-HAZARDOUS
Soil Pile 7	TCLP RCRA metals, TCLP Cd	NON-HAZARDOUS
Soil Pile 8A	Total VOCs, SVOCs B/N, TCLP RCRA metals, PCBs, flashpoint, pH	NON-HAZARDOUS
Soil Pile 8B	TCL VOCs, TCLP RCRA metals, flashpoint	NON-HAZARDOUS
OW-PA-CROCK CONTENTS	TCL VOCs, TCLP RCRA metals, PCBs	NON-HAZARDOUS
OW-PA-Concrete-1	RCRA metals	NON-HAZARDOUS

OPTECH contracted with Ricelli Enterprises, an appropriately permitted transporter, to transport a total of 533.65 tons of non-hazardous soil, for disposal at Mill Seat Landfill in Bergen, New York. The non-hazardous soil was shipped off-Site on April 6, 2012 and April 16, 2012 and included all soil piles with the exception of Soil Pile 3A and Soil Pile 4 which were determined to be hazardous. OPTECH contracted Page E.T.C. Inc. to transport a total of 127.05 tons of hazardous soil to CWM Chemical Services Inc. landfill in Model City, New York. Hazardous soil was transported from the Site on April 16, 2012 and April 20, 2012. As outlined in the RI and IRM Work Plan, all trucks were tarped and dry decontaminated prior to leaving the Site.

### **3.2.4 Excavation Groundwater**

De-watering of the excavation was anticipated as a result of the relatively shallow static groundwater depth. However, careful planning around seasonal weather and favorable groundwater conditions allowed for the removal of affected soils without requiring groundwater removal or disposal. Groundwater was encountered at a depth of approximately seven (7) feet bgs during the soil removal activity. Throughout the soil removal phase, excavation areas that received favorable confirmatory soil sample results were immediately backfilled to help minimize the necessity for de-watering. Because groundwater was manageable during soil removal due to a slow rate of infiltration,

backfilling was conducted concurrently with soil removal was in progress elsewhere in the excavation.

Approximately 2 feet of groundwater collected in the floor of the deepest area of the excavation, located in the northeastern portion of the plating area. Approximately 105 tons of imported clean 2"-minus stone was placed in the base of the excavation in all areas where 2"-diameter PVC backfilled wells were installed, including the entire northern portion of the excavation. The stone ranged from 4 to 5 feet in thickness. The high permeability of the stone further precluded the need to dewater the excavation.

### **3.2.5 Well Installations, Remedial Solution Application, Backfilling, Site Restoration**

During soil excavation, eight (8) miniwells were removed and disposed of with the contaminated soil. These miniwells included: PA-08S, PA-08D, PA-09, PA-10S, PA-10D, PA-12, PA-13 and PA-14. Prior to backfilling with on-site fill materials, and seven (7) back-filled wells were installed by OPTECH as replacements to allow access to groundwater for monitoring and introduction of remedial agents, as necessary. The wells were constructed of 2-inch diameter PVC with 5-foot or 10-foot slotted screen intervals (depending on total depth) and solid risers to grade. The wells were installed to total depths ranging from 10 to 13 feet below grade. The backfilled wells maintained the same well designations as the wells they replaced with the exception of the addition of SB-27. Well locations are illustrated on Figure 4.

105 tons of clean washed stone (2"-minus) was transported to the Site from an approved outside source, and placed on the bottom of the excavation around each well screen. The stone was intended to act as a filter mechanism for the backfilled wells. Approximately 5 feet of stone was placed at each well. Stone was also placed in the entire northern portion of the excavation which was excavated to an average total depth of approximately 13 feet bgs.

Hexavalent chromium is known to be highly soluble in water. Injection of a carbohydrate solution such as diluted molasses can promote the in situ microbial reduction of  $\text{Cr}^{+6}$  to  $\text{Cr}^{+3}$  (Suthersan, 1997). The carbohydrates contained in molasses, consist mostly of sucrose, and are readily degraded by the heterotrophic microorganisms

present in the groundwater aquifer, which depleted all the available dissolved oxygen present, leading to the development of reducing conditions. The primary end product of the  $\text{Cr}^{+6}$  to  $\text{Cr}^{+3}$  reduction process is  $\text{Cr}(\text{OH})_3$ , a form of  $\text{Cr}^{+3}$ , which readily precipitates out of solution under alkaline to moderately acidic conditions.  $\text{Cr}(\text{OH})_3$  precipitate is essentially an insoluble, stable precipitate, immobilized in the soil matrix of the aquifer (Nyer and Suthersan, 1996).

OPTECH mobilized a 55-gallon drum of food-grade molasses to the site to serve as an in-situ remedial agent. Approximately 300 gallons of a 5-10% molasses and water solution was applied by spraying it onto the exposed excavation sidewalls and floor prior to backfilling. The solution was applied by a gasoline-powered pump system attached to a hose. The goal of the molasses application was to create reducing conditions at the limits of the excavation to promote the reduction of residual  $\text{Cr}^{+6}$  to  $\text{Cr}^{+3}$ .

The clean stone was overlain by staged soil from the excavation area that did not require disposal and uncontaminated project-derived crushed building demolition debris generated from previous work. These wells were installed for monitoring purposes and to potentially act as a mechanism to introduce molasses or other remedial agents for any future remedial purposes.

A backhoe was used to complete the final grading of the backfill material in the former plating area. The entire backfilled area was back-bladed with the front backhoe bucket in an effort to restore the area to an elevation indicative of pre-remedial conditions.

### **3.2.6 Chimney Base Description and Sampling**

Features associated with AOC-2 included the exposed concrete base of the former smoke stack (herein referred to as the “chimney base”). The chimney base is located immediately adjacent to the northwest corner of the plating area (see Figure 3). The concrete chimney base is measured at twelve (12) feet in diameter and twelve (12) feet below grade. Based on the observations from soil boring PA-6, which is proximate to the chimney base, it appears that the chimney base footer rests on the bedrock surface, at approximately 16.5 feet below ground.

At the time of investigation, the chimney base was approximately three-quarters full of building demolition debris (wood, brick and concrete), storm runoff, and a minor amount of ash material. The majority of the ash contained in the chimney was disposed of in 2009 as part of the demolition of 354 Whitney Street. Representative samples of the solid and liquid contained within the structure were collected for proper waste characterization and disposal purposes. Analytical results indicated that the materials contained in the chimney were non-hazardous. Analytical data is provided in Appendix E. Figure 4 illustrates the location of this feature.

#### Chimney Base Cleaning and Backfilling

On March 26, 2012, OPTECH mobilized to the Site and began remedial activity at the former chimney base. Preparations included construction of a double poly sheeting-lined staging pad located adjacent to the chimney base which allowed free liquid to drain back into the chimney base as saturated solids were removed. OPTECH used an excavator to remove all of the solid contents contained within the chimney base. Once removed, a representative soil/ash sample (OW-chimney ash2) was collected for waste characterization purposes and analyzed for RCRA metals, pH and corrosivity. The solids primarily consisted of building demolition debris that fell into the pit when the 354 Whitney Street building was demolished. These solids were combined with the previously described non-hazardous soil piles that were removed from AOC-2 for off-Site disposal at the Mill Seat Landfill in Bergen, New York. Approximately 50 tons of waste solids were removed from the chimney base and disposed of with the non-hazardous plating area soils.

Once the majority of the solids were removed, the standing water was pumped out of the structure and containerized in two 275 gallon capacity plastic totes and two 55-gallon steel drums. Appropriate air monitoring was conducted within the confined space structure, including measuring for oxygen content, LEL, VOCs, H<sub>2</sub>S, and CO. An OPTECH laborer donned appropriate PPE including a Tyvek suit and tethered safety harness for emergency egress for the manual cleaning of the chimney base. A ladder was used for access in and out of the structure. Once free of all solids, OPTECH power-washed the structure's concrete interior walls and floor. The concrete was observed to be

in very good condition with no apparent cracking. A slow seeping of groundwater was observed in a few locations at the base of the structure where the sidewalls meet the floor.

Including cleaning fluids, approximately 555 gallons of waste water was generated from the chimney base structure. Previous waste characterization sampling conducted in April 2011 on the water contained within the chimney base structure indicated it was non-hazardous for all parameters tested. The water was disposed of by OPTECH at the Environmental & Industrial Contracting Services Green (EICS) in Niagara Falls, New York. A total of 533.65 tons of non-hazardous soil was disposed of from AOC-2 including the solid material removed from this structure.

OPTECH backfilled the chimney base to the existing grade with uncontaminated fill materials from the berm material located along Whitney Street.

**Table 6 - AOC-2 Work Plan Deviations – Remedial Strategy**

<b>Work Plan Section</b>	<b>Action in Work Plan</b>	<b>Revised Plan/Action</b>	<b>Justification</b>
3.2.4 – Detailed Investigation of Former Metal Plating Area	Test pits will also be excavated within AOC-2 to determine if connections exist between AOC-2 and other areas of Site.	Only grid-based soil borings and mini-well installations were used to perform the detailed investigation of AOC-2.	AOC-1 activities and soil boring & miniwell installation program provided sufficient data to develop remedial strategy.
3.2.4 - Detailed Investigation of Former Metal Plating Area	On-Site stabilization of soils is proposed prior to disposal.	Soil removal followed by transportation and disposal was the remedial action conducted without on-Site soil stabilization.	Waste characterization sample results, projected cost of equipment required for soil removal and stabilization, and limited volume of hazardous waste level soil requiring disposal precluded stabilization from being cost-effective.
3.2.9 – Plating Area Source Removal	Groundwater will be removed from AOC-2 for treatment and disposal at approved facilities.	No groundwater was removed from the plating area excavation during soil removal activity.	Proper soil removal management, slow groundwater infiltration precluded need for groundwater removal.

### **3.3 AOC-3: Hydraulic Vehicle Lift/Oil Tank and Soil Removal**

The hydraulic vehicle lift, associated hydraulic tank, and petroleum-impacted soil removals at AOC-3 was conducted concurrently with the remedial activities at AOC-2. The underground hydraulic lift and associated hydraulic oil tank, located in the north-central portion of the Site, were removed by TREC on June 2, 2011 by use of a 200 series John Deere excavator. The vehicle lift and associated hydraulic oil tank were all contained within a concrete vault-like structure. The hydraulic oil reservoir was located at the east end of the former lift vault and appeared to be empty, with no apparent holes or leaks. It was uncovered at a depth of approximately 2 to 5 feet below grade and measured 4.5 feet long by 1.1 feet in diameter. The tank was disposed of as scrap metal. Photos of the lift and tank removal are included in Appendix B. Figure 2 illustrates the location of this AOC.

No staining or odors were observed in the soils located immediately beneath the oil reservoir. At a depth of 9 feet below grade, discolored soil and PID readings up to 28 ppm were observed. Bedrock was encountered at a depth of approximately 11 feet below grade. The excavation was backfilled following the lift and tank removal and no sample was collected since a sample had been previously collected at nearby TP-03 as part of the 2008 RI efforts.

On April 4, 2012, OPTECH re-excavated a test pit in the area where the former hydraulic lift had been removed. Soil in the upper 9 feet did not reveal any staining or elevated PID readings. Soils ranging in depth from 9 to 11 feet below grade exhibited grey staining, petroleum odors, and elevated PID readings ranging from 3 to 27 ppm. No sheen was observed on the minor amount of groundwater that infiltrated into the excavation. OPTECH removed approximately 5 tons of petroleum-impacted soil from the 9 to 11 foot depth interval. The material was combined with the staged, non-hazardous, petroleum-contaminated AOC-2 soil from the plating area for eventual disposal.

Following soil removal and confirmatory sample collection, the test pit was backfilled with imported clean stone and uncontaminated soil from the 0 to 9 foot depth interval. Confirmatory soil sampling is described in Section 3.5.3 below.

### **3.4 Governing Documents**

The applicable governing plans were adhered to during execution of the work plan.

#### **3.4.1 Site Specific Health and Safety Plan (HASP)**

The remedial work described within this report was conducted in full compliance with governmental requirements, including Site and worker safety requirements mandated by Federal Occupational safety and Health Administration (OSHA). On-Site workers were required to have OSHA 1910.120 Hazardous Waste Operations Certification. The HASP was complied with for the remedial and invasive work conducted at the Site.

#### **3.4.2 Quality Assurance Project Plan (QAPP)**

The NYSDEC-approved QAPP was prepared using the USEPA Region 2 Brownfield Site-Specific QAPP template. The QAPP describes the specific policies, objectives, organization, functional activities and quality assurance/ quality control (QA/QC) activities designed to achieve the project data quality objectives.

#### **3.4.3 Community Air Monitoring Plan (CAMP)**

The CAMP implemented during the IRM work was conducted in accordance with the New York State Department of Health (NYSDOH) Generic CAMP. VOC and particulate concentrations were monitored at upwind and downwind perimeter locations during intrusive work and during handling of contaminated material. Particulates were monitored using TSI Dust Traks and TSI Sidepacks. A MiniRAE 2000 and 3000 photoionization detector (PID) was used to monitor for VOCs. Action levels specified in the NYSDOH Generic CAMP were not exceeded during the IRM work, including during backfilling. The CAMP daily field data sheets are included in Appendix C.

The CAMP was adhered to during ground intrusive remedial activities and during any on-site activity that had the potential to create airborne VOCs or particulates (i.e., excavation, backfilling, site grading, etc.). Action levels for both VOCs and particulates were not exceeded during the remedial work. Measures were taken throughout the project to ensure that action levels were not exceeded.

### 3.5 Waste Disposal Summary

The waste streams generated as part of the IRM removals and their associated waste characterization and disposal details are discussed in Sections 3.2, 3.3, and 3.4 above. Waste disposal documentation, including manifests and bills-of-lading, is included in Appendix D. A summary of total quantities removed for off-Site disposal during the IRMs is provided in the following table.

**Table 7 – Waste Stream Summary**

<b>IRM WASTE STREAMS</b>	<b>WASTE QUANTITY</b>
<b><u>AOC-1:</u></b>	
UST WASTE PRODUCT (PETROLEUM & MINERAL SPIRITS)	14,245 gallons
NON-HAZARDOUS SAND BEDDING MATERIAL	213.28 tons
HAZARDOUS TANK 6 VAULT FLOOR SOIL	14.6 tons
UST CLEANINGS/SLUDGE	1,110 gallons
VAULT WATER	14,700 gallons
<b><u>AOC-2</u></b>	
NON-HAZARDOUS SOIL (INCLUDES CHIMNEY SOLIDS)	533.65 tons
HAZARDOUS SOIL	127.05 tons
DECONTAMINATION & PURGE WATER	100 gallons
FRAC TANK CLEANINGS (SOLIDS)	1 x 55 gallon drum
CHIMNEY BASE WASTE WATER	555 gallons
<b><u>AOC-3</u></b>	
PETROLEUM-IMPACTED SOIL	5 tons (disposed of with AOC-2 non-haz soil)

### 3.6 Remedial Performance/Documentation Sampling

Confirmatory soil samples collected at each AOC are described in this Section. The attached Table 9-1 and Table 9-2 summarize results of the AOC-2 confirmatory soil sampling, and all exceedances of SCOs are highlighted. AOC-2 sample locations are shown on Figure 4.

Data Usability Summary Reports (DUSRs) were prepared for data generated in this remedial performance evaluation program. These DUSRs are included in Appendix F, and associated raw data is provided electronically on CD. Nancy Potak, a qualified third party Data Validator was selected to generate the DUSRs for confirmatory soil samples collected from the Plating Area. As indicated in each DUSR, included as Appendix F of this report, only minor variances were noted and all of the data was usable.

### 3.6.1 AOC-1 Confirmatory Soil Sampling

One confirmatory soil sample (Tank 6 Vault-9.5') was collected from the bottom of the Tank 6 vault at a depth of approximately 9.5 feet below grade. The peak PID reading obtained from the soil sample was 423 ppm. Laboratory analysis of this sample included the following parameters:

- Target Compound List (TCL) VOCs 8260B
- TCL Semi-Volatile Organic Compounds (SVOCs)
- Resource Conservation and Recovery Act (RCRA) Metals

Lab results are summarized in the following table.

**Table 8 - AOC-1 Confirmatory Soil Sample Results (Tank 6 Vault-9.5')**

Detected Analyte	Unrestricted Use SCO	Commercial Use SCO	Analytical Result
Ethylbenzene	<b>1,000(ppb)</b>	<b>390,000(ppb)</b>	5,010(ppb)
Xylene (mixed)	<b>260(ppb)</b>	<b>390,000(ppb)</b>	78,050(ppb)
Napthalene	<b>12,000(ppb)</b>	<b>500,000(ppb)</b>	554(ppb)
2-Methylnapthalene	<b>NL</b>	<b>NL</b>	1,010(ppb)
Arsenic	<b>13(ppm)</b>	<b>16(ppm)</b>	5.23(ppm)
Barium	<b>350(ppm)</b>	<b>400(ppm)</b>	48.4(ppm)
Cadmium	<b>2.5(ppm)</b>	<b>9.3(ppm)</b>	<0.584(ppm)

<b>Detected Analyte</b>	<b>Unrestricted Use SCO</b>	<b>Commercial Use SCO</b>	<b>Analytical Result</b>
Chromium	<b>30(ppm)</b>	<b>1,500(ppm)</b>	10.8(ppm)
Lead	<b>63(ppm)</b>	<b>1,000(ppm)</b>	22.1(ppm)
Mercury	<b>0.18(ppm)</b>	<b>2.8(ppm)</b>	0.0096(ppm)

NL= not listed

All detected petroleum constituents and RCRA metals fell below the applicable Commercial Use SCO.

### **3.6.2 AOC-2 Confirmatory Soil Sampling**

Confirmatory soil sampling was conducted per the procedures outlined in the approved RI/IRM Work Plan, the approved QAPP and the NYSDEC DER-10 guidance document. Sample methodology included sidewall sample collection at a minimum of every 30 linear feet around the excavation perimeter and excavation floor sampling at a minimum of every 900 square feet. Samples were collected throughout the soil removal phase as the excavation process progressed. Sample identifications such as “OW-PA-SWC-1” indicate that the sample was collected from the excavation sidewall (“SWC” signifies “sidewall confirmatory”). Sample identifications such as “OW-PA-FC-2B” indicate that the sample was collected from the excavation floor (“FC” signifies “floor confirmatory”). Figure 4 illustrates the location of all confirmatory samples collected.

Sidewall samples were collected from the entire soil column, gathering soil from the bottom of the sidewall to the top and combining it into one representative composite sample. Floor samples generally consisted of between two (2) and four (4) soil grabs which were combined into one composite sample for each floor area. Following sample collection, samples were immediately placed on ice and stored in a cooler until they were relinquished to Paradigm Environmental Services, Inc. (Paradigm), an appropriately certified contract laboratory located in Rochester, New York. Samples were kept in the

custody of Lu Engineers at all times until relinquished to Paradigm. Samples were typically relinquished every day that they were collected to ensure validity.

The majority of samples were analyzed for RCRA metals only by EPA method SW846: 3050/6010, 7471. Since petroleum impacts were observed in the northeastern portion of the excavation, samples OW-PA-SWC-10, OW-PA-FC-11 and OW-PA-SWC-12 were also analyzed for VOCs by EPA method 8260B. Sample results are presented in the attached Table 9-1.

All confirmatory sample locations are illustrated on Figure 4, including grab sample locations for each composite floor sample collected. Analytical data is presented in the attached Table 9-1 and Table 9-2. A total of fifteen (15) confirmatory soil samples were collected from the excavation, including four (4) floor samples and eleven (11) sidewall samples. Three (3) of the fifteen (15) samples (OW-PA-FC2, OW-PA-SWC4 and OW-PA-SWC7) exceeded applicable Commercial Reuse SCOs for chromium, copper or arsenic, as indicated on Table 9-1 and Table 9-2. Additional soil removal was conducted at each of these locations and a second “B” sample was collected. The second round samples for OW-PA-FC-2B and OW-PA-SWC-4B were analyzed for the full RCRA metals list and of OW-PA-SWC-7B which was analyzed for chromium only since all seven of the other RCRA metals were below applicable standards in the first-round sample (OW-PA-SWC-7).

#### AOC-2 Confirmatory Soil Sample Results

Confirmatory sample results were compared to NYSDEC Part 375-6.8(b) Restricted Commercial Use SCOs. Per NYSDEC request, confirmatory sample results were also evaluated for the Protection of Groundwater for hexavalent chromium only. The Protection of Groundwater standard for Cr<sup>+6</sup> is 19 mg/kg. All plating area confirmatory samples were analyzed for RCRA metals by EPA Method SW846: 3050/6010/7471. Samples from OW-PA-SWC-10, OW-PA-FC-11 and OW-PA-SWC-12 were also analyzed for VOCs by EPA method 8260B, because petroleum impacts were observed in the vicinity of where they were taken.

As indicated in Table 9-1, the three above-listed samples did not exceed Commercial Use SCOs.

Table 9-2 indicates that excavation floor and sidewall confirmatory samples OW-PA-FC2B, OW-SWC-5, and OW-PA-SWC-6 exceeded the Commercial Use SCO for cadmium. Sample OW-PA-SWC-7B exceeded the Commercial Use SCO and Protection of Groundwater SCO for hexavalent chromium.

### 3.6.3 AOC-3 Confirmatory Sample Results

Confirmatory floor sample OW-Hydraulic Lift TP-4/4/12 was collected from the AOC-3 excavation floor at a depth of approximately 11 feet below grade, just above bedrock. The peak PID reading on the soil sample was 3.2 ppm. Following sample collection, the sample was immediately placed on ice and stored in a cooler until being relinquished to Paradigm, an appropriately certified laboratory. The sample was analyzed for TCL VOCs by EPA Method 8260B. Figure 2 illustrates the sample location and provides an overview of the location of the former hydraulic lift and associated hydraulic oil tank.

Confirmatory sample results indicate that several VOCs were detected in sample OW-Hydraulic Lift TP-4/4/12. All VOCs detected in this sample were below the Commercial Use and Unrestricted Use SCOs. The sample results for the detected analytes are presented in the following table.

**Table 10 – AOC-3 Confirmatory Soil Sample Results (Hydraulic Lift TP)**

Detected Analyte	Unrestricted Use SCO (ppb)	Commercial Use SCO (ppb)	Analytical Result (ppb)
Acetone	50	500,000	38.0 JB
Ethylbenzene	1,000	390,000	34.9
Isopropylbenzene	NL	NL	20.3
Methylcyclohexane	NL	NL	8.85
Tetrachloroethene	1,300	150,000	15.3
Toluene	700	500,000	5.97 J
Trichloroethene	470	200,000	7.44 J
Xylene (mixed)	260	500,000	148.6

J= value is estimated

B= compound detected in associated method blank

NL= not listed

Laboratory analytical reports are presented in Appendix E of this report.

### **3.7 Imported Backfill**

A total of 105.11 tons of crushed stone backfill was imported from Hansen Aggregates New York, LLC Honeoye Falls Plant 364 and The Dolomite Group in Brockport (both New York State Department of Transportation (NYSDOT)-approved sources) to backfill the bottom of the AOC-2 plating area excavation. The crushed stone was used as a demarcation layer in the bottom of the excavation and as backfill surrounding the replacement well screens. Backfill well installation is discussed in Section 3.3.6.

In addition, 37.55 tons of imported general fill from Valley Sand and Gravel, Inc. in Scottsville, New York (NYSDOT Source #4-31G) was placed as backfill above the crushed stone in the AOC-2 plating area excavation. Backfill documentation is provided in Appendix G.

### **3.8 Contamination Remaining at the Site**

The IRMs have successfully removed soil contamination from the Site above applicable SCGs, with the exception of cadmium and chromium impacts in the soil at the AOC-2 plating area. Three of the twelve confirmatory soil samples exceeded the Commercial Use SCO of 9.3 ppm for cadmium. In addition, eight of the twelve samples exceeded the Protection of Groundwater SCO of 19 ppm for Cr<sup>+6</sup>. The remaining soil contamination in the AOC-2 plating area can be easily distinguished from the crushed stone/gravel and berm material backfill that was used as a demarcation layer. Remaining cadmium and chromium contamination in the plating area is shown on Figure 4.

It was determined that residual contaminated soil would remain in-place subsequent to the IRM. Persistent contaminated soil and groundwater beneath the Site will be addressed through a Site Management Plan or institutional and/or engineering controls to protect human health and the environment. These engineering and institutional controls (EC/ICs) are described in the following sections. Long-term

management of these EC/ICs and residual contamination will be performed under SMP approved by the NYSDEC.

### **3.9 Cover System**

Exposure to remaining contamination in soil/fill at the Site is prevented by a Site-wide cover system. This cover system is comprised of a minimum of 12 inches of crushed stone, asphalt pavement, concrete building slabs, and hard fill from previous building demolitions (berm material). Figure 6 in the *Site Investigation/Remedial Alternatives Report* shows the location of each cover type at the Site. An Excavation Work Plan, which outlines the procedures required in the event that the cover system and/or underlying residual contamination are disturbed, is provided as an appendix in the SMP.

### **3.10 Other Engineering Controls**

The IRMs did not require the construction of any other engineering control systems.

### **3.11 Institutional Controls**

It is anticipated that the final Site remedy will include institutional controls consisting of an environmental easement to limit Site use and require compliance with a SMP. The City will also impose a “flag” on the Site in its Building Information System (BIS), which requires a plan review by the Department of Environmental Quality prior to issuance of any new permit.

# Site Photographs

## Orchard-Whitney St. IRMs

Photo No. 1 – AOC-1 concrete cover removal over UST vault system.

Photo No. 2 - AOC-1: Concrete removal at Tank 9 vault and poly cover over UST vaults.

Photo No. 3 – AOC-1: Steel reinforced concrete over cap over Tank 9 vault (10,000 gal tank).

Photo No. 4 – AOC-1: Initial uncovering of 10,000 gal Tank 9.

Photo No. 5 – AOC-1: View looking south at exposed 10,000-gal Tank 9.

Photo No. 6 – AOC-1: View looking north at uncovered UST farm and vault system.

# Site Photographs

## Orchard-Whitney St. IRMs

Photo No. 7. – AOC-1: View looking east at Tank 7 & Tank 8.

Photo No. 8. – AOC-1: View looking north at product removal in Tank 9.

Photo No. 9. – AOC-1: View looking south at UST product removal by Egan Env.

Photo No. 10. - AOC-1: View looking north at exposed tank farm.

Photo No. 11 – AOC-1: Overhead view looking down on USTs & vault configuration.

Photo No. 12 – AOC-1: Uncovering Tank 7. Note it is full of product.

# Site Photographs Orchard-Whitney St. IRMs

Photo No. 13 – AOC-1: Looking southeast at TREC removing waste product with drum vac..

Photo No. 14 – AOC-1: View looking north of tanks ready for removal.

Photo No. 15 – AOC-1: Inerting tank prior to removal.

Photo No. 16 – AOC-1: Removing Tank 1.

Photo No. 17 – AOC-1: Tank 6, 7 and 8 ready for disposal as scrap metal.

Photo No. 18 – AOC-1: Removing 10,000-gal Tank 9 and placing on trailer for disposal.

# Site Photographs

## Orchard-Whitney St. IRMs

Photo No. 19 – AOC-1: Tank 7 rust holes.

Photo No. 20 – AOC-1: Tank 9 Vault full of chromium-impacted water from tunnel

Photo No. 21 – AOC-1: Staging petroleum-impacted sand bedding material.

Photo No. 22. – AOC-1: TREC loading petroleum-contaminated sand bedding.

Photo No. 23. – View north at vault cleaned of contaminated bedding material.

Photo No. 24. – AOC-1: Placing flowable fill in Tank 9 vault.

# Site Photographs

## Orchard-Whitney St. IRMs

Photo No. 25 – AOC-2: Looking east;OPTECH laying out poly to hold concrete chimney base contents.

Photo No. 26 –AOC-2: Building demolition debris removed from chimney base.

Photo No. 27- AOC-2: Excavator removing building demo debris from chimney.

Photo No. 28- AOC-2: OPTECH steam-cleaning interior concrete of chimney.

Photo No. 29. – AOC-2:Removal of residual chimney waste liquids.

Photo No. 30- AOC-2: Liquid waste removal in chimney with drum vac.

# Site Photographs

## Orchard-Whitney St. IRMs

Photo No. 31 – AOC-2: Cleaned chimney base prior to backfilling.

Photo No. 32 – AOC-2: Backfilling of chimney base with site-derived backfill.

Photo No. 33- AOC-2: Concrete slab removal at SE corner plating area. Note UST vault wall.

Photo No. 34 – AOC-2: Initial soil removal in plating area. VCT crock being removed, center.

Photo No. 35 – AOC-2: Removal of 8” CI pipe, south-central plating area.

Photo No. 36- AOC-2: Looking northeast at plating area excavation in progress.

# Site Photographs

## Orchard-Whitney St. IRMs

Photo No. 37 – AOC-2: Applying remedial molasses solution to west wall of excavation.

Photo No. 38 – AOC-2: Installing backfill well PA-09 in western portion of excavation.

Photo No. 39 – AOC-2: View looking northeast at plating area excavation area.

Photo No. 40 – AOC-2: Stockpiling of contaminated soil on northern portion of Site.

Photo No. 41 – AOC-2: Backfilling southern portion of excavation area.

Photo No. 42- AOC-2: Looking southwest from northeast corner at buried concrete footer structure.

# Site Photographs

## Orchard-Whitney St. IRMs

Photo No. 43 – AOC-2: Looking south at PA-14 area. Note concrete wall of Tank 9 vault.

Photo No. 44 – Looking north at northern half of open excavation & staged soil piles.

Photo No. 45– AOC-2: View of remedial molasses mixture being applied to exposed soil.

Photo No. 46 – AOC-2: Uncovering petroleum-impacted soil by PA-13.

Photo No. 47 – AOC-2: Looking north at plating area excavation overview.

Photo No. 48- AOC-2: Applying molasses remedial agent to open excavation.

# Site Photographs

## Orchard-Whitney St. IRMs

Photo No. 49 – AOC-2: Exposed east wall of plating area/Tank 9 vault wall after molasses.

Photo No. 50 – AOC-2: View to south at backfilled wells with clean stone fill.

Photo No. 51– AOC-2: Backfilling of northeast corner.

Photo No. 52 – AOC-2: Loading of hazardous soil on Low Rise slab.

Photo No. 53 – AOC-2: Breaking of chromium contaminated concrete block.

Photo No. 54- AOC-2: Loading of non-hazardous soil from plating area.

# Site Photographs

## Orchard-Whitney St. IRMs

**Photo No. 55 – AOC-3: Looking northeast at removal of hydraulic vehicle lift.**

**Photo No. 56 – AOC-3: Empty hydraulic oil tank from vehicle lift.**

**Photo No. 57– View of solid waste and fill materials in vehicle lift vault.**

Note:  
Backgrounds were unusually high today despite the fact that it had rained last night & wet down site. But downwind concentrations were close to the upwind concentrations. Concentrations (Both Up & Dn) decreased slightly as it got later in the day.

# Test 001

Instrument		Data Properties	
Model	Dust Trak	Start Date	09/25/2008
Meter S/N	16449	Start Time	07:53:36
		Stop Date	09/25/2008
		Stop Time	14:50:10
		Total Time	0:06:56:34
		Logging Interval	1 seconds
