11. Field Equipment Decontamination and Management of Investigation-Derived Waste	21
11.1 Decontamination Area	21

11.2 Equipment Decontamination 21

 11.2.1 Sampling Equipment Decontamination 21

 11.2.2 Personnel Decontamination 21

 11.2.3 Vehicular Decontamination 21

11.3 Management of Investigation-Derived Waste..... 22

 11.3.1 Decontamination Fluids..... 22

 11.3.2 Drilling Cuttings 22

 11.3.3 Development and Purge Water 22

 11.3.4 Dedicated Sampling Equipment, Personal Protective Equipment (PPE), and General Refuse..... 23

12. Field Instruments and Calibration 24

13. Analytical Program 25

 13.1 Environmental Sample Analyses 25

 13.2 IDW Characterization 25

LIST OF FIGURES (PRESENTED IN THE RI WORK PLAN)

- 1) Site Location
- 2) Site Layout
- 3) 2008 Validated Sample Locations
- 4) State and Federal Wetlands and FEMA Floodplain
- 5) Locations of Recognized Environmental Conditions
- 6) Proposed Sample Locations
- 7) Historic Soils Data and Proposed Investigative Locations for Soils
- 8) Historic Groundwater Data and Proposed Investigative Locations for Groundwater
- 9) Well Construction Diagrams

LIST OF ATTACHMENTS

- A Test Pit Log
- B Chain of Custody
- C Surface Soil Sample Log
- D Soil Boring Log
- E Well Completion Log
- F Well Development Log
- G Well Decommissioning Record
- H Low Flow Groundwater Sampling Log
- I Hydraulic Conductivity Test Log
- J Air/Soil Vapor Sampling Form

1. INTRODUCTION

This Field Sampling and Analysis Plan (FSAP) has been developed by O'Brien & Gere (OBG) on behalf of the City of Rochester (City) to outline procedures to be followed during implementation of field investigation activities to support the Remedial Investigation (RI) at an approximate 15.4 acre portion of the former Vacuum Oil Refinery (1, 13, 31, 69, and 75 Cottage Street; 100 Riverview Place; 102 Violetta Street; and 1320 S. Plymouth Avenue) (Site).

This FSAP is a component of the RI Work Plan developed by OBG for the Site. It should be noted that not all of the activities identified in this FSAP are currently identified to be conducted; however, methods and procedures have been provided herein should such sampling be warranted.

1.1 OVERVIEW OF FIELD ACTIVITIES

The following field activities may be completed as part of the RI:

- Utility locating;
- Limited Site clearing;
- Geophysical survey;
- Test pit activities;
- Surface soil sampling;
- Soil boring and subsurface soil sampling;
- Overburden and bedrock monitoring well installation and development;
- Groundwater sampling;
- Hydraulic conductivity testing;
- Soil vapor sampling;
- Decontamination of sampling equipment; and
- Management of Investigation-Derived Waste (IDW).

2. GENERAL FIELD GUIDELINES

2.1 SITE HAZARDS

Generally, potential hazards within the Site will be identified during site reconnaissance by the project team prior to the initiation of RI field activities. Additional safety measures to be undertaken for the work performed as part of the RI will be addressed in the site-specific Health and Safety Plan (HASP).

2.2 UNDERGROUND UTILITIES

New York State law requires that Dig Safely of New York be notified at least two working days, and not more than 10 working days, before subsurface work is conducted. Dig Safely New York (800-272-4480) will be contacted to initiate the locating activities. Companies with subsurface utilities present will locate and mark out subsurface utility lines. However, Dig Safely New York contractors will only locate utilities on public property and rights-of-way.

If utility locations are still unknown at the conclusion, underground utilities within the Site, including electric lines, gas lines, storm and sanitary sewers, and communication lines will need to be identified through a process other than Dig Safely of New York prior to initiation of drilling and other subsurface work. If additional subsurface utility locating is considered necessary, a private locating company will be contracted to locate on-Site utilities that have not been identified by Dig Safely New York contractors or the City.

It may be necessary to alter the proposed locations of soil borings, test pits, and/or monitoring wells due to the location of underground utilities, existing surface or subsurface site features, or topography. Any such modifications will be made at the discretion of the Field Team Leader if the revised proposed sample location is within approximately 10-15 feet (ft.) of the original proposed sample location. Proposed modifications at a further distance than 10-15 ft. from their original intended position will be made in consultation with the City and NYSDEC staff, as appropriate.

2.3 FIELD LOG BOOKS

Field activities will be documented in field log books to provide a record of the activities conducted. Entries will be of sufficient detail that a complete daily record of significant events, observations, and measurements is developed. Accordingly:

- Field books will be assigned a unique identification number;
- Field books will be bound with consecutively numbered pages;
- Field books will be controlled by the Field Manager while fieldwork is in progress;
- Entries will be written with waterproof ink;
- Entries will be signed and dated at the conclusion of each day of fieldwork;
- Erroneous entries made while fieldwork is in progress will be corrected by the person that made the entries. Corrections will be made by drawing a line through the error, entering the correct information, and initialing the correction; and
- Corrections necessary after departing the field will be made by the person who entered the original information. Corrections will be made by drawing a line through the error, entering the correct information, and initialing and dating the time of the correction.

Daily field book entries, for those days when field activities are on-going, will include the following information:

- Location of field activity;
- Date and time of entry;
- Names, titles of any Site visitors, as well as the date and time entering and leaving the Site;
- Weather information, for example: temperature, cloud coverage, wind speed, and direction;

- Purpose of field activity;
- A detailed description of the fieldwork conducted;
- Sample media (*e.g.*, soil, groundwater, etc.);
- Description of sampling point(s);
- Analytical parameters (*e.g.*, volatile organic compounds [VOCs], semi-volatile organic compounds [SVOCs], metals, polychlorinated biphenyls [PCBs], pesticides);
- Date and time of collection;
- Sample identification number(s);
- Field observations;
- Field measurements made (*e.g.*, VOCs using a photoionization detector (PID), pH, temperature, conductivity, water level);
- References for maps and photographs of the sampling site(s); and
- Information pertaining to sample documentation such as:
 - » Bottle lot numbers
 - » Dates and method of sample shipments
 - » Chain-of-custody record numbers
 - » Shippers tracking number.

3. GEOPHYSICAL SURVEY

A limited Site geophysical survey will be conducted to the extent possible (*e.g.*, cleared portions of the Site) with an electromagnetic survey unit to locate magnetic anomalies associated with ferrous objects such as steel tanks. The survey will be performed by moving the electromagnetic survey unit across select portions of the Site.

A limited electromagnetic survey investigation will follow to investigate magnetic anomalies located by the terrain conductivity meter. A letter report will be generated that will include a colored contour map presenting the identified anomalies overlaid on the Site reference grid. Potential subsurface anomalies, such as possible subsurface utilities, tanks, foundations, and pit locations, will be marked for subsequent investigation. The data from the geophysical survey will be used to focus subsequent subsurface investigations.

4. EXPLORATORY TEST PITS / EXCAVATIONS

Test pitting and/or excavating will be conducted during the RI. Test pits will allow for visual characterization of subsurface soil conditions and the collection of grab soil samples. Prior to completing a test pit or excavation, underground utilities should be identified as discussed in Section 2.2 of this document. Should active underground utilities be located in the vicinity of the intended excavation, hand or vacuum excavation methods should be employed, as appropriate, to confirm the location and depth prior to initiating the excavation.

The size and type of excavator and/or backhoe used to complete the test pits will be selected based on the anticipated depth and overall size of the excavation required to meet the project objectives. At no time will field personnel enter a test pit/excavation unless it has been deemed safe to enter by an Excavation Competent person based on training and experience required by 29CFR 1926.652 or the excavation is less than 4 ft. in depth.

Soil removed from the test pits will be managed as follows:

- All soils removed will be placed on poly sheeting adjacent to the test pit so as to not contaminate surface soils at the Site;
- Any drums, non-aqueous phase liquid (NAPL), or free product encountered will be over packed or containerized for appropriate off-Site disposal; and
- If no drums, NAPL, or free product is encountered, the soils staged on poly sheeting will be placed back into the test pit in the same general strata from which it was removed.

The sampling approach from test pits/excavations will be to bring soil samples to the surface using the backhoe or excavator to avoid entry into the test pit/excavation. The field sampler will select a soil sample(s) that is representative of the excavated soil that best targets the zone of interest. Each soil sample will be placed in a re-sealable plastic (*e.g.*, Ziploc®) bag filled approximately half full. The bag will be labeled with the boring number and interval sampled. After allowing the bagged soil to warm to the equivalent of room temperature, the tip of the sample probe attached to the PID will be inserted into the bag to measure the headspace for organic vapors. VOC samples selected for laboratory analyses will not be collected from the sealable plastic bags used for headspace screening. Rather, tentative VOC samples will concurrently be placed in laboratory-supplied containers and placed in a pre-chilled cooler. Upon selection of the interval, the corresponding VOC sample will be kept and the remainder of containerized soils will be managed as IDW.

Soil samples retrieved will be described for: 1) soil type; 2) color; 3) moisture content; 4) texture; 5) grain size and shape; 6) consistency; 7) evidence of staining or other chemically-related impacts; and 8) any other relevant observations. In addition, soil will be screened with a PID to allow evaluation of the bulk volatile organic concentration of each soil sample. Soils will be described in accordance with the Unified Soil Classification System (USCS). Descriptions of the materials encountered in the test pit/excavation will be recorded on the Test Pit Log. An example of the Test Pit Log is provided in [Attachment A](#).

Soil samples selected for analysis will be based on PID screening and/or visual/olfactory indications of potential impacts. Soil samples will be placed in appropriate laboratory supplied jars for the identified analyses. Samples for laboratory analysis will be submitted to an approved New York State Department of Health (NYSDOH) Laboratories Approval Program (ELAP)-certified laboratory under Chain-of-custody procedures. An example Chain-of-custody is included in [Attachment B](#). Analyses will be conducted using United States Environmental Protection Agency (USEPA) methodologies. Samples will be managed in accordance with the Quality Control Document (QCP).

5. SURFACE SOIL SAMPLING PROCEDURES

Surface soil samples will be used to develop an understanding of Site-specific human health exposure and fish and wildlife impact, and to document those conditions. Surface soil samples will also be submitted for laboratory analysis to evaluate soil quality and potential remedial activities, if necessary.

Surface soil samples will be collecting using designated plastic, disposable trowels.

5.1 SURFACE SOIL SAMPLING AND FIELD SCREENING

- A portion of surface soil samples will be collected from a depth of 0-2 inches (in.) below ground surface (bgs), excluding vegetative cover, as defined in Section 3.5.1 of DER-10;
- A portion of surface soil samples will be collected from a depth of 0-2 ft. bgs for historic fill material evaluation purposes;
- Soil samples retrieved will be described for: 1) soil type; 2) color; 3) moisture content; 4) texture; 5) grain size and shape; 6) consistency; 7) evidence of staining or other chemically-related impacts; and 8) any other relevant observations. In addition, soil will be screened with a PID to allow evaluation of the bulk volatile organic concentration of each soil sample;
- Soils will be described in accordance with the USCS. This descriptive information will be recorded on a surface soil sample log form. An example of the typical surface soil sample log form is provided in [Attachment C](#);
- If identified in the RI Work Plan, a PID equipped with a 10.6 eV lamp will be used to screen the soil. Samples for headspace screening will be collected. A representative portion of each soil sample will be placed in a resealable plastic (*e.g.*, Ziploc®) bag filled approximately half full. The bag will be labeled with the boring number and interval sampled. After allowing the bagged soil to warm to the equivalent of room temperature, the tip of the sample probe attached to the PID will be inserted into the bag to measure the headspace for organic vapors;
- VOC samples selected for laboratory analyses will not be collected from the sealable plastic bags used for headspace screening. Rather, tentative VOC samples will concurrently be placed in laboratory-supplied containers and placed in a pre-chilled cooler. Upon selection of the interval, the corresponding VOC sample will be kept and the remainder of containerized soils will be managed as IDW; and
- Samples for laboratory analysis will be submitted to a NYSDOH ELAP-certified laboratory under standard chain-of-custody procedures. An example chain-of-custody is included in [Attachment B](#). Analyses will be conducted using USEPA methodologies. Samples will be managed in accordance with the QCP.

6. SOIL BORING AND SUBSURFACE SAMPLING PROCEDURES

Soil borings will be advanced to facilitate the collection of subsurface soil samples and the installation of monitoring wells. Subsurface soil samples will be used to develop an understanding of site-specific geologic conditions, and to document those conditions. Subsurface soil samples will also be submitted for laboratory analysis to evaluate soil quality and potential remedial activities, if necessary.

Historical site drilling conditions indicate the presence of shallow bedrock and the potential for subsurface structures. As such, soil borings will be advanced using conventional hollow stem auger (HSA) methods to enable a deeper penetration than direct-push methods. Depending on the location and proximity to Site features (*i.e.*, power lines), an alternate drill rig may be utilized to maintain a safe working distance from potential hazards.

6.1 SOIL BORING DRILLING METHOD

The conventional hollow stem auger (HSA) drilling method is typically used to collect shallow and deeper overburden soils and create boreholes for permanent monitoring well installations. This method is advantageous in that it typically allows for the advancement of borings through denser soils, and when coupled with split spoon sampling conducted in accordance with ASTM Method D1586, can provide geotechnical information. The disadvantage of this method is that it is typically more time consuming to drill and sample, and to decontaminate the equipment than direct-push methods. In addition, this method can generate a high volume of soil cuttings that may require off-Site disposal.

6.2 SUBSURFACE SOIL SAMPLING AND FIELD SCREENING

- Soil samples will be collected continuously from the ground surface to the bottom of the borings;
- Soil samples retrieved from the borehole will be described for: 1) percent recovery; 2) soil type; 3) color; 4) moisture content; 5) texture; 6) grain size and shape; 7) consistency; 8) evidence of staining or other chemically-related impacts; and 9) any other relevant observations. In addition, soil will be screened with a PID to allow evaluation of the bulk volatile organic concentration of each soil sample;
- Soils will be described in accordance with the USCS. This descriptive information will be recorded on a soil boring log form. An example of the typical soil boring log form is provided in [Attachment D](#);
- A PID equipped with a 10.6 eV lamp will be used to screen the length of the soil core upon opening of split-spoons. Samples for headspace screening will be collected. A representative portion of each soil sample will be placed in a re-sealable plastic (*e.g.*, Ziploc®) bag filled approximately half full. The bag will be labeled with the boring number and interval sampled. After allowing the bagged soil to warm to the equivalent of room temperature, the tip of the sample probe attached to the PID will be inserted into the bag to measure the headspace for organic vapors;
- VOC samples selected for laboratory analyses will not be collected from the sealable plastic bags used for headspace screening. Rather, tentative VOC samples will concurrently be placed in laboratory-supplied containers and placed in a pre-chilled cooler. Upon selection of the interval, the corresponding VOC sample will be kept and the remainder of containerized soils will be managed as IDW;
- Sample intervals will be selected for soil sample collection based on visual observation, olfactory observation, and/or PID screening;
- Depth determination will be as identified in Section 3.2 of the RI Work Plan; and
- Samples for laboratory analysis will be submitted to a NYSDOH ELAP-certified laboratory under standard chain-of-custody procedures. An example chain-of-custody is included in [Attachment B](#). Analyses will be conducted using USEPA methodologies. Samples will be managed in accordance with the QCP.

6.3 BOREHOLE ABANDONMENT

Boreholes will be abandoned with a Portland cement or a Portland cement and bentonite grout mix.

7. MONITORING WELL INSTALLATION AND DEVELOPMENT

Monitoring wells will be used to evaluate the hydrogeologic conditions and groundwater quality. Monitoring wells will be installed to allow characterization of groundwater levels, groundwater flow systems, and groundwater quality.

7.1 TYPES OF MONITORING WELLS

Permanent groundwater monitoring wells may be installed in overburden and/or bedrock. A Well Completion Log will be completed for each well installed. An example of the Well Completion Log is provided in [Attachment E](#).

7.1.1 Permanent Overburden Monitoring Well Installation and Construction

Permanent monitoring wells will be used when long-term monitoring data or hydraulic conductivity testing is required. Permanent monitoring wells will be installed using HSA drilling methods.

Borings for the monitoring wells will be advanced through the overburden using conventional 4¼ in. inner diameter (ID) HSA drilling methods. Soil samples will be collected continuously through the overburden via 2-in. diameter split-spoons in accordance with ASTM Method D-1586. A geologist will be on-Site to complete boring logs and screen samples with a PID as presented in Section 6.2. In addition, soil samples will be submitted for laboratory analysis from the installation of the groundwater monitoring wells using the procedures identified in Section 6.2.

The groundwater monitoring wells will be constructed of 2 in. polyvinyl chloride (PVC) casing with 10 ft. of #10 slot (0.010 in.) PVC well screen. If free product is suspected, a #20 slot PVC well screen will be substituted. The annulus around the screens will be backfilled with clean silica sand having appropriate size in comparison to the screen slot size. The volume of filter pack required to fill the annular space will be calculated and compared to the volume installed. This information will be recorded in the field log book. The filter pack will be installed in increments as the augers or casings are withdrawn to enable monitoring of progress and to prevent bridging. If bridging occurs, break the bridge before proceeding with installation. The filter pack should extend a minimum of 2 ft. above the top of the screen.

A bentonite chip or pellet seal with a minimum thickness of 2 ft. will be placed above the filter pack. If the seal is installed above the water table, it will be manually hydrated using potable water. The remainder of the annular space will be filled with cement-bentonite grout to ground surface. The grout will be allowed to set for a minimum of 24 hours before wells are developed. The well casing will be left approximately 2 ft. abovegrade and will be completed with a stick up steel protective locking casing set in a concrete pad. An approximate 2-ft. diameter concrete well pad will be installed around the protective casing. The well pad will be sloped away from the protective casing to shed surface water away from the well head. The well identification will be clearly visible on the inside and outside of the lid of the protective casing.

The top of the well casing and ground surface will be marked and surveyed to 0.01 ft., and the elevation will be measured relative to a fixed benchmark or datum. The measuring point on all wells will be on the innermost PVC casing.

Drill cuttings will be containerized in a 12 cubic yard roll-off for later characterization and disposal as set forth in Section 11.

The drilling rig, augers, and drill rod will be decontaminated following the procedures identified in Section 11.

7.1.2 Permanent Bedrock Monitoring Well Installation and Construction

Bedrock monitoring wells will be installed in a manner to minimize the potential for contaminants previously detected in overburden at the Site from vertically migrating downward to the bedrock below (*i.e.*, double cased). The monitoring wells will be installed utilizing a truck or all-terrain vehicle (ATV) mounted drill rig and 6 ¼ in. ID HSA drilling techniques. A geologist will complete a boring log and screen soils with a PID as set forth in Section 6.2. Once the augers reach top of bedrock, the augers will be used to advance a rock socket a minimum of

2 ft. into competent rock and a 4 in. permanent steel casing will be grouted in place to isolate the overburden. The grout will be allowed to set for a minimum of 24 hours before drilling continues. Actual depths of bedrock monitoring wells will be determined in the field, but are assumed to be installed approximately 10 ft. into competent bedrock.

After the grout has cured, continuous rock cores will be collected using an HQ core barrel and water rotary drilling techniques. The cores will be logged by a geologist and the observations will be recorded on the well's boring log. The roller bit will be advanced to the well completion depth, which will be selected at the first significant water bearing fracture based on the core information obtained from the adjacent monitoring well(s) and observations of gain or loss of drilling water during drilling. Drilling water loss or gain during rock coring or rotary drilling will be recorded on the boring logs and in the field notebook.

In the event the surrounding bedrock is found to be friable in nature, PVC well screen and riser will be installed. The wells will be constructed of 2 in. ID, flush joint, schedule 40 PVC riser pipe with 10-20 ft. of #10 slot PVC well screen that will be lowered through the center of the casing. The base of each well will be equipped with threaded bottom plugs and the top of each well will be equipped with a vented, locking J-plug cap. In addition, each well will be labeled using indelible ink and a designated measuring point will be notched into the top of the PVC riser pipe to provide a permanent reference point for subsequent total depth and depth to water measurements.

After setting the PVC screen and riser, sand will be introduced gradually inside the open borehole and steel 4 in. casing to fill the annular space between the screen and the borehole adjacent to the screen. The sand pack will extend from the bottom of the boring to approximately 2 ft. above the top of the screen. The sand pack will consist of clean, graded #1 silica sand. A bentonite pellet seal will be placed above the sand pack and hydrated to form a seal at least 2 ft. thick. A thick cement-bentonite grout will be placed from the top of the bentonite pellet seal to a depth of approximately 2 ft. below the ground surface.

The grout material will consist of Type I Portland cement mixed with either a powdered or granular bentonite. The grout mixture will be prepared in accordance with ASTM D 5092-90, such that approximately 3 to 5 pounds of bentonite will be mixed with 6½ to 7 gallons of water per 94 pound sack of cement. The grout will be introduced via a tremie pipe lowered to just above the top of the bentonite pellet seal. As the grout is pumped into the borehole, the tremie pipe will be lifted so that the grout is pumped into the borehole in a manner to minimize air pockets or voids in the grout.

The well casing will be left approximately 2 ft. abovegrade and will be completed with a stick up steel protective locking casing set in a concrete pad. An approximate 2-ft. diameter concrete well pad will be installed around the protective casing. The well pad will be sloped away from the protective casing to shed surface water away from the well head. The well identification will be clearly visible on the inside and outside of the lid of the protective casing.

The top of the well casing and ground surface will be marked and surveyed to 0.01 ft., and the elevation will be measured relative to a fixed benchmark or datum. The measuring point on all wells will be on the innermost PVC casing.

Drill cuttings and drilling fluids will be containerized in a 12 cubic yard roll-off and 6,900 gallon frac tank, respectively, for later characterization and disposal as set forth in Section 11.

The drilling rig, augers, and drill rod will be decontaminated following the procedures identified in Section 11.

7.1.3 Nested Well Construction

Five proposed nested overburden/bedrock groundwater monitoring well pairs are proposed to be installed as depicted on [Figure 6](#) of the RI Work Plan. One overburden groundwater monitoring well and one bedrock groundwater monitoring well will be installed in separate casings and boreholes from each other; however, these monitoring wells will be installed in close proximity to each other. The screens for the overburden and bedrock groundwater will be designed to obtain groundwater from different aquifers or water-bearing zones

and will be sealed to prevent migration of groundwater between the nested groundwater monitoring wells. Examples of monitoring well construction are depicted on [Figure 9](#) of the RI Work Plan.

7.1.4 Casing Installation

HSA drilling methods will be used to advance the borehole through the overburden to the terminal depth of the casing. A steel casing fitted with an end cap will then be lowered through the auger string. The annular space between the borehole wall and the surface casing will be filled with cement/bentonite grout using a tremie pipe as the auger string is removed. The grout will be allowed to cure for a minimum of 24 hours prior to further borehole advancement. If additional casings are necessary to reach the required terminal depth for well installation, casings will be the correct size to accommodate advancing augers inside the casing.

7.1.5 Temporary Monitoring Well Installation

Temporary groundwater monitoring wells will be constructed of 1 in. PVC casing with 5 ft. of #10 slot (0.010 in.) PVC well screen. If free product is suspected, a #20 slot PVC well screen will be substituted. The annulus around the screens will be backfilled with clean silica sand having appropriate size in comparison to the screen slot size. The volume of filter pack required to fill the annular space will be calculated and compared to the volume installed. This information will be recorded in the field log book. The filter pack will be installed in increments as the augers, rods, or casings are withdrawn to enable monitoring of progress and to prevent bridging. If bridging occurs, break the bridge before proceeding with installation. The filter pack should extend a minimum of 2 ft. above the top of the screen.

A bentonite chip or pellet seal with a minimum thickness of 2 ft. will be placed above the filter pack. If the seal is installed above the water table, it will be manually hydrated using potable water. The remainder of the annular space will be filled with cement-bentonite grout to ground surface.

Upon retrieval of groundwater samples, the temporary monitoring wells will be decommissioned using appropriate procedures.

Soil cuttings will be containerized in a 12 cubic yard roll-off for later characterization and disposal as set forth in Section 11.

The drilling rig, augers, and/or drill rod will be decontaminated following the procedures identified in Section 11.

7.2 MONITORING WELL DEVELOPMENT

Well development will not occur sooner than 48 hours following groundwater monitoring well installation. The groundwater monitoring wells will be developed using conventional bailing and surging techniques. Each monitoring well will be developed prior to groundwater sampling to:

- Remove fine-grained materials from the sand pack and formation;
- Reduce the turbidity of groundwater samples;
- Remove introduced drilling fluids, if any; and
- Increase the yield of the groundwater monitoring well and provide better hydraulic communication with the surrounding formation.

Development will consist of surging the well and removal of five well volumes using either a bailer or pump. In the event that low yielding wells are present, development of those wells will consist of purging dry three times over three days or at another agreed to timeframe. Groundwater parameters will be recorded before, during, and after well development. Parameters monitored will only include turbidity. Well development data will be recorded on a Well Development Log. An example Well Development Log is provided in [Attachment F](#).

Water levels will be measured in each well to the nearest 0.01 ft. prior to development.

The wells will be developed until turbidity is less than 50 nephelometric turbidity units (NTUs). If 50 NTUs is not achievable after three hours of development by low flow (100 milliliters per minute [ml/min]) purging; the

volume of water lost (if any) during well installation plus 5 or more total well volumes have been removed and the turbidity has remained stable; well development will be considered complete. Development water will be managed in accordance with Section 11. If the volume of water to be developed is deemed to be significant by OBG field personnel, the NYSDEC Project Manager will be notified to discuss an alternative approach to well development.

Water and drill cuttings generated during the drilling and development processes will be contained in a 6,900 gallon frac tank and 12 cubic yard roll-off, respectively, for later characterization and disposal as set forth in Section 11.

7.3 MONITORING WELL ABANDONMENT

There may be occasions when monitoring wells will require abandonment. For temporary monitoring wells, the approach will be to pull the PVC well materials from the borehole, and backfill the remaining open portion of the borehole with cement/bentonite grout to approximately 0.5 ft. below the ground surface. The ground surface will be restored to a similar condition as the surrounding grade (*e.g.* topsoil). For permanent monitoring wells, depending on the Site-specific subsurface geologic conditions and nature of contamination, the abandonment approach will be in accordance with NYSDEC Policy CP-43 – Groundwater Monitoring Well Decommissioning Policy. Details regarding the well abandonment will be documented on a Well Decommissioning Record. An example is provided in [Attachment G](#).

8. GROUNDWATER SAMPLING PROCEDURES

Groundwater samples may be collected using various methods depending on specific project objectives. These methods may include hand bailing, pumping, or low-flow purging and sampling.

8.1 LOW FLOW GROUNDWATER SAMPLING METHOD

- Equipment will be decontaminated prior to use at each location;
- Prior to sampling, the static water level and thickness of any light non-aqueous phase liquid (LNAPL) or dense non-aqueous phase liquid (DNAPL) will be measured to the nearest 0.01 ft. from the surveyed well elevation mark on the top of the PVC casing with a decontaminated oil/water interface probe. NAPL thickness will be confirmed using a clear bailer or a weighted string. The measurement will be recorded in the field book;
- Prior to commencing daily sampling activities, the groundwater quality monitoring probes/meters including pH, conductivity, oxidation-reduction potential (ORP), dissolved oxygen, and turbidity will be calibrated in accordance with the manufacturer's instructions. At a minimum, two-point calibrations will be conducted for pH, conductivity, and turbidity. The dissolved oxygen probe will be checked against a zero-dissolved oxygen solution. In addition, the dissolved oxygen calibration will be corrected for local barometric pressure and elevation. Calibration results will be recorded in the field log notebook;
- The intake of the submersible bladder pump will be positioned in the center of the screened interval and the upper end of the tubing will be connected to the flow through cell. Flow rate will be measured during purging with a calibrated container and shall not exceed 0.5 liters/min (500 ml/min). Initially, a flow rate between 100 ml/min and 250 ml/min will be used. The drawdown will be monitored using a water level probe and the flow rate will be reduced if the drawdown exceeds 0.3 ft. Efforts should be made to minimize the generation of air bubbles in the sample tubing by either increasing the flow rate as appropriate, or restricting the flow by clamping the tubing;
- During purging, pH, specific conductivity, temperature, ORP, dissolved oxygen, and turbidity will be monitored and recorded at time intervals sufficient to evacuate the volume of the flow-through cell, generally 3 minutes apart with a small volume (~250 ml) flow through cell. Before commencing purging, the volume of the cell will be calculated;
- Turbidity samples are collected before the flow-through-cell. A "T" connector coupled with a valve is connected between the pump's tubing and flow-through-cell. When a turbidity measurement is required, the valve is opened to allow the groundwater to flow into a container. The valve is closed and the container sample is then placed in the turbidimeter;
- Water quality parameter information along with water level readings to monitor drawdown will be recorded on the Low Flow Groundwater Sampling Log. An example of the Low Flow Groundwater Sampling Log is provided in [Attachment H](#); and
- Well sampling will commence after equilibration of water quality parameters. The equilibration guidelines are as follows:
 - » Temperature ± 3% of measurement
 - » pH ± 0.1 pH units
 - » Specific conductivity ± 3% of measurement
 - » Redox ±10 mV
 - » DO ±10% of measurement
 - » Turbidity ± 10% of measurement.

If the water level will not stabilize even at lower flow rates then the well will not be able to be sampled using the low flow method. In this situation, the well will be pumped to dryness and sample collection may commence once a sufficient volume of water is present in the well to fill the required sample bottles.

- Prior to collecting the sample, the flow-through cell will be disconnected from the tubing. Groundwater will be allowed to flow from the tubing into the sample container carefully so as to limit aeration of the sample. If preservative is present in a container, the container will not be overfilled;
- Keep sample bottles in cooler containing ice with their caps on until they are ready to receive samples. The type of analysis for which a sample is collected determines the type of container, preservative, holding time, and filtering requirement as specified in the QCP. Samples are transferred directly from the bailer to the container. The container should hold any necessary preservative and should be correctly labeled before the sample is transferred to it;
- When ready to fill the bottles, remove them from their transport containers. Prepare them to receive the samples;
- Inspect labels to see that the samples are properly identified;
- Arrange the sampling containers to allow for convenient filling;
- Fill the containers that will undergo analysis for VOCs first. The VOC containers should be filled with zero headspace, and then securely capped;
- Fill each sample container in accordance with the QCP or other sampling outline;
- Return each sample bottle to its proper transport container;
- Record the appearance of the groundwater on the Low Flow Groundwater Sampling Log ([Attachment H](#));
- Samples must not be allowed to freeze;
- Record the date and time;
- Secure the well head;
- Samples for laboratory analysis will be submitted to an approved NYSDOH ELAP-certified laboratory under chain-of-custody procedures. An example chain-of-custody is included in [Attachment B](#). The sample containers will be labeled, placed in a laboratory-supplied cooler, with protective packaging (*i.e.*, bubble wrap) and packed on ice (to maintain a temperature of $<6^{\circ}$ C). The cooler will be shipped no later than 48 hours after sample collection. Analyses will be conducted using USEPA methodologies. Samples will be managed in accordance with the QCP; and
- Purge water will be managed in accordance with Section 11.

9. HYDRAULIC CONDUCTIVITY TESTING

Hydraulic conductivity “slug” tests involve observing the recovery of water levels toward an equilibrium level after an initial perturbation. The perturbation may be either a sudden rise or fall in water level. During a falling head slug test, an inert rod of known volume will be quickly introduced into the well to cause a water level rise. Following equilibration of the water level a rising head slug test can be initiated by removing the slug to lower the water level. Procedures and equipment requirements may vary depending on the rate of the water-level recovery.

A minimum of 10 of the new overburden groundwater monitoring wells (to be selected to evaluate the range of subsurface conditions present at the Site), all five of the new bedrock monitoring wells, and the one existing monitoring well at the Site will be tested in accordance with the following procedures:

Initial Activities and Setup

- Determine the type of test to be performed based on the following:
 - » If the screened interval of the well straddles the water table, only use a rising head test;
 - » If the screened interval of the well is fully submerged below the water, then a rising and falling head test will be conducted;
- Record appropriate data on the Hydraulic Conductivity Test Log including the date of test, well identification, well construction details (*i.e.*, screen length, screen diameter, riser diameter, depth to top of screen, sand pack length, sand pack diameter, and depth to top of sand pack), type of test and names of field personnel. An example of the Hydraulic Conductivity Test Log is provided in [Attachment I](#);
- Measure the static depth to water (only wells which have fully recovered to static level conditions after drilling and development should be tested) and the depth to the bottom of the well to be tested and calculate the length of the water column;
- Clean the downhole equipment (*e.g.*, pressure transducer, associated cable and, if used, the bailer or slug and associated line) following the decontamination procedures provided in Section 11 before initiating test(s) at each well;
- Select a means of displacing water (*e.g.*, inert rod, bailer, etc.); and
- Program the data collection frequency into the data logger/pressure transducer that is suitable for the anticipated permeability of the water-bearing formation. For example, water levels in highly permeable formations will likely recover very quickly, sometimes within tens of seconds. In this case, the data collection interval should small enough to capture the anticipated high rate of recovery. Water levels in low to moderately permeable formations may take tens of minutes to hours to recover. In this case, a variable data collection frequency may be more appropriate where initially data is collected at very small intervals whereas later data collection occurs at larger intervals. This is helpful in reducing the size of the data file and subsequent data manipulation and reduction.

Rising Head Test

- Connect the pressure transducer to the data logger and lower the transducer into the well to a depth that will not interfere with the insertion of the slug but does not exceed the operating range of the transducer;
- Secure the transducer cable such that it does not slip deeper into the well. If the edges of the well casing are sharp, cover them with cloth or duct tape to protect the transducer cable;
- Check the data logger for connectivity and communication with the transducer;
- Monitor the static water level recorded by the transducer for one to two minutes;
- Insert the slug into the well such that the top of the slug is approximately 0.5 ft. below the initial static water level;

- Prior to beginning the rising head test, monitor the water level for a period of time to make sure water levels have reached near-static conditions after the slug has been introduced;
- Begin data logging for 5 to 10 seconds before insertion of the slug;
- Quickly create a water level change by removing the slug from the well. Avoid entanglement of the slug and rope with the transducer cable;
- Monitor water level rise both from the data logger and by periodic hand measurements. Record hand measurements on a Hydraulic Conductivity Test Log. An example Hydraulic Conductivity Test Log is provided in [Attachment I](#);
- Continue to collect data until water level in the well has reached at least 5% of static, after which the test will be terminated; and
- Review the data file and associated data plot to make sure data has been collected in an appropriate manner. The observed initial displacement in the transducer file should be comparable (within 95%) of the anticipated initial displacement based on the slug geometry. If not, the test will be repeated to confirm the data.

Combined Falling Head and Rising Head Test

- Double check data logger settings;
- Begin data logging for 5 to 10 seconds before insertion of the slug;
- Tie a sufficient length of polypropylene rope to the slug;
- Quickly create a water level change by inserting the slug into the well making sure to that the top of the slug has been fully submerged below the static water level, but no more than 1 ft below the static water level to avoid contact with the transducer. Avoid entanglement of the slug and rope with the transducer cable;
- Secure the rope from the slug to the well casing such that the slug will not slip deeper into the well during the test;
- Monitor water level decline both from the data logger and by periodic hand measurements. Record hand measurements on a Hydraulic Conductivity Test Log. An example Hydraulic Conductivity Test Log is provided in [Attachment I](#);
- Continue to collect data until water level in the well has recovered to within 5% of static, after which the test will be terminated;
- Review the data file and associated data plot to make sure data has been collected in an appropriate manner;
- Re-program the data logger/pressure transducer for the start of the rising head test;
- Double check data logger settings;
- Begin data logging for 5 to 10 seconds before removal of the slug;
- Quickly create a water level change by removing the slug from the well. Avoid entanglement of the slug and rope with the transducer cable;
- Monitor water level rise both from the data logger and by periodic hand measurements. Record hand measurements on a Hydraulic Conductivity Test Log. An example Hydraulic Conductivity Test Log is provided in [Attachment I](#);
- Continue to collect data until water level in the well has recovered to within 5% of static, after which the test will be terminated; and

- Review the data file and associated data plot to make sure data has been collected in an appropriate manner. The observed initial displacement in the transducer file should be comparable (within 95%) of the anticipated initial displacement based on the slug geometry. If not, the test will be repeated to confirm the data.

Rising head or combined rising and falling head tests should be repeated at least twice, or ideally three times at each groundwater monitoring well.

10. SOIL VAPOR SAMPLING

10.1 GENERAL

The objective for the soil vapor intrusion (SVI) investigation is to assess the potential for migration of subsurface VOC contaminants in soil vapor off-Site. To accomplish this objective, a subsurface soil vapor sampling program will be completed. As shown on **Figure 6** of the RI Work Plan, subsurface soil vapor samples will be obtained at several locations along the southwestern perimeter of the Site where the Site abuts residential property.

The SVI investigation will be performed in accordance with NYSDOH *Guidance for Evaluating Soil Vapor Intrusion in the State of New York*, dated October 2006. The proposed on-Site SVI sampling will be performed at a time when vehicular equipment is not operating in the vicinity of the proposed SVI sample locations. Descriptions of specific components proposed as part of the FSAP are provided in the subsequent sections. In general the specific component includes the completion of a subsurface soil vapor sampling program.

10.2 Soil Vapor Sampling Program

To evaluate the extent of VOCs in soil vapor and to assess whether there is a potential for off-Site vapor migration to the west and southwest near abutting residential properties, eight soil gas samples will be collected for laboratory analysis of VOCs. OBG will install eight temporary soil vapor sampling points (*i.e.*, SV-101 through SV-108) at eight locations along the western/southwestern edge of the Site. The proposed locations where the soil vapor samples will be collected are shown on **Figure 6** of the RI Work Plan.

10.2.1 Soil Vapor Sampling Point Installation

Each soil vapor sampling point will be installed to a depth of approximately 4 ft. bgs. Each temporary sampling point will be installed using a slide hammer to manually drive rods to install the screened implant (*i.e.*, AMS Soil Vapor Probe drive rod tooling or equivalent). As the drive rods are removed, the annular space around the sampling point will be packed with porous, inert backfill material (*i.e.*, glass beads) to a point approximately 6 inches above the screened interval of the implant. The annular space around the sample tubing will be sealed with approximately 0.5 ft. of a dry granular bentonite to prevent water infiltration/infilling across the sample inlet. The remainder of the boring's annular space will be sealed above the sampling zone to ground surface with a bentonite slurry to prevent ambient air infiltration. The sampling points will consist of a stainless steel sample point with a 1 in. wire screen attached to an appropriate length of ¼ in. outside diameter Teflon tubing.

10.2.2 Soil Vapor Sampling and Analysis

Following installation of the soil vapor sample points and prior to the collection of the soil vapor samples, the sampling tubing will be purged of ambient air. A minimum of one and a maximum of three volumes of air will be purged from each sample point prior to sample collection. In addition, tracer gas screening will be used during sampling to evaluate the adequacy of the sampling technique, as described in Section 2.7.5 of the NYSDOH *Guidance for Evaluating Soil Vapor Intrusion in the State of New York*, dated October 2006. The tracer gas screening procedure that will be employed at the Site is presented below:

- Helium tracer gas will be retained around the sample location by filling a specially fitted plastic bucket, which is positioned over the sample location.
- The bucket will be sealed to the ground surface using a bentonite slurry.
- Helium tracer gas will be introduced into the top of the bucket through a valved fitting while a valved fitting located at the bottom of the bucket will be opened to let the ambient air out while introducing the helium. The valves will be closed after the bucket is filled with helium.
- A modified bulkhead compression fitting will be present at the top of the bucket to allow the sample tubing to pass through the compression fitting and exit the bucket.
- After the bucket is filled with helium, the sample tube will be attached to a personal air-monitoring pump.

- The pump will be pre-calibrated to extract soil vapor at a rate of 0.1 liters per minute into a 1 liter Tedlar® bag.
- A hand-held helium detector will be attached to the Tedlar® bag to confirm there is no short circuiting of ambient air around the annular space of the borehole (*e.g.*, the presence or absence of helium in soil vapor will confirm the integrity of the borehole seal prior to sampling).
- The soil vapor probe will be purged for a period of three to five minutes to screen for helium/short circuiting (*i.e.*, presence of helium).
- If helium is detected during this procedure, the short-circuit will be corrected and the screening procedure will be repeated until it passes.
- If helium is not detected, the sample tubing will be attached to the sampling equipment and soil vapor sample collection using a stainless steel SUMMA® vacuum canister will be initiated.
- After sample collection is completed, the bucket will be checked using the valve fitting on the bucket to verify that helium is still present in the bucket around the sample probe location.
- Finally, following the completion of sample collection, the personal monitoring pump will be reconnected to the sample tubing, and the Tedlar® bag and helium meter will be used to screen for helium in soil vapor collected from the soil vapor sample tubing to verify that short circuiting had not occurred during sampling. If helium is not detected, the sample will be submitted to the laboratory for analysis. If helium is detected, the NYSDEC project manager will be notified and a decision will be made as to whether or not the sample will be submitted for analysis, or if an additional sample should be obtained following an evaluation of the integrity of the borehole seal.

Following the completion of the soil vapor samples, the location of each sample location will be surveyed for horizontal control.

Soil vapor samples will be collected using batch certified-clean 6-liter stainless steel SUMMA® vacuum canisters equipped with laboratory-calibrated fixed rate flow controllers. The flow controllers will be set to collect soil vapor samples for a period of four hours, resulting in a sample rate of approximately 0.025 liters per minute. Sample collection will be terminated before the canister vacuum is exhausted, and the canister vacuum level at the beginning and end of sample collection will be recorded on an Air/Soil Vapor Sampling Form (an example Air/Soil Vapor Sampling Form is presented in [Attachment J](#)).

After sample collection, the soil vapor sampling lines will be cut, plugged, folded, and buried beneath native soil, and the ground surface restored to pre-existing condition.

The soil vapor samples will be submitted to a NYSDOH ELAP-certified laboratory for VOC analysis using USEPA Method TO-15 under appropriate chain-of-custody protocols. An example chain-of-custody is included in [Attachment B](#). Each SUMMA® canister will be labeled with the sample identification, the start and end time of sample collection, date, project identification, and required laboratory analysis. The same information will be recorded on the Soil Vapor Sample Collection Field Forms. Samples will be analyzed for chlorinated compounds with a reporting limit of 0.25 micrograms per cubic meter ($\mu\text{g}/\text{m}^3$) for TCE and 1 $\mu\text{g}/\text{m}^3$ for all other compounds.

Analysis will be conducted using USEPA methodologies. Samples will be managed in accordance with the QCP.

10.2.3 Documentation

Digital photos will be taken of the SUMMA® canister and surrounding area, and noteworthy items. At the time of canister retrieval, noticeable changes in the condition of the sampling area will be noted.

Sample identifications, SUMMA® canister identification numbers, flow controller identification numbers, initial and final vacuum readings, date and time of sample collection, and PID readings will be documented for each air sample on the Air/Soil Vapor Sampling Form provided in [Attachment J](#). Chain-of-custody documentation will be maintained throughout sample collection and analysis in accordance with the QCP.

10.2.4 Quality Assurance/Quality Control

Sampling activities will include appropriate Quality Assurance/Quality Control (QA/QC) during sample collection. For the purposes of this investigation one duplicate soil vapor sample will be collected. The duplicate sample will be collected simultaneously (*i.e.*, over the same time interval) and from the same sample point as the original sample. QA/QC procedures will be followed as outlined in the QCP.

10.2.5 Soil Vapor Analyses

A total of nine subsurface soil vapor (eight original and one duplicate) will be submitted to an ELAP-certified laboratory, certified by NYSDOH for USEPA Method TO-15 analysis. Samples will be analyzed for chlorinated VOCs with a reporting limit of 0.25 $\mu\text{g}/\text{m}^3$ for TCE and 1 $\mu\text{g}/\text{m}^3$ for all other compounds. Note: actual reporting limits may be higher depending on the amount of dilution needed for analysis.

11. FIELD EQUIPMENT DECONTAMINATION AND MANAGEMENT OF INVESTIGATION-DERIVED WASTE

11.1 DECONTAMINATION AREA

One or more temporary decontamination areas lined with polyethylene sheeting will be constructed on-Site for use during decontamination of the drilling equipment. Prior to construction of decontamination areas, the location(s) will be discussed with the NYSDEC. Decontamination fluids will be collected in 55 gallon drums (to be staged on pallets) and then transferred to a 6,900 gallon frac tank and managed as described in Section 11.3. A shipping container may also be staged near the decontamination or IDW area for storage.

If a crushed concrete haul road becomes necessary for better access within the Site for decontamination or IDW transportation purposes, additional details would be discussed with the NYSDEC under separate cover and prior to construction.

11.2 EQUIPMENT DECONTAMINATION

The following procedures will be used to decontaminate equipment used during the RI activities.

- Drilling equipment such as augers, bits, rods, tools, split-spoon samplers, and backhoe/bucket will be cleaned with a high-pressure, hot water pressure washing unit before beginning work, following the completion of borings and groundwater monitoring wells, and prior to exiting the Site;
- Tools, drill rods, and augers will be placed on polyethylene plastic sheets following pressure washing. Direct contact with the ground will be avoided;
- Augers, rods, and tools will be decontaminated between each drilling location according to the above procedures; and
- The back of the drill rig and tools, augers, and rods will be decontaminated at the completion of the work and prior to leaving the Site.

11.2.1 Sampling Equipment Decontamination

Prior to sampling, the non-dedicated sampling equipment (*e.g.*, bowls, spoons, interface probes) will be washed with potable water and soapy water (*e.g.*, Alconox). Decontamination may take place at the sampling location as long as all liquids are contained in pails, buckets, etc.

The sampling equipment will then be rinsed with potable water. Equipment can be placed on polyethylene sheets or aluminum foil, if necessary. At no time will washed equipment be placed directly on the ground.

11.2.2 Personnel Decontamination

All personnel leaving the Site will undergo footwear decontamination prior to leaving the Site. This will consist of a boot wash using a soapy water (*e.g.*, Alconox) brush of footwear, followed by a potable water rinse, or the removal of disposable overboots. The wash and rinse water and/or disposable overboots will be containerized and managed as IDW as detailed in Section 11.3.1. The personnel decontamination area will be located on City-owned land immediately north of Flint Street (a continuation of the 1320 S. Plymouth Avenue tax parcel) as depicted on [Figure 6](#).

11.2.3 Vehicular Decontamination

All vehicles and motorized equipment leaving the Site will undergo decontamination prior to leaving the Site. This will consist of soapy water (*e.g.*, Alconox) followed by a potable water rinse. At a minimum, the tires and/or tracks of the vehicles will be decontaminated along with the bucket of the excavator. In addition, visible soils that may be on an excavator chassis or other locations of the machine will also be decontaminated. During cold weather months when temperatures may be below freezing and the use of water is not feasible, an air compressor may be utilized to remove visible soils. The wash and rinse water, or solids generated from use of the air compressor during winter months, will be containerized and managed as IDW as detailed in Section 11.3.1. The vehicular decontamination area will be located on City-owned land immediately north of Flint Street (a continuation of the 1320 S. Plymouth Avenue tax parcel) as depicted on [Figure 6](#).

11.3 MANAGEMENT OF INVESTIGATION-DERIVED WASTE

IDW produced during this project include soil, groundwater, decontamination water, personal protective equipment (PPE), and dedicated sampling equipment that may be potentially contaminated. IDW will be handled and disposed of in accordance with applicable state and federal regulations. Disposal options will be evaluated after characterization of the wastes. Unless otherwise mentioned, 55 gallon drums will be placed on pallets to allow for more efficient storage and handling.

The following paragraphs describe procedures to be followed for handling each waste material.

11.3.1 Decontamination Fluids

Decontamination fluids associated with drilling and sampling activities will be containerized in 55 gallon drums and then transferred to a 6,900 gallon frac tank and temporarily staged at the Site at a location convenient for transportation to and from the Site. At the conclusion of field activities, these materials will be appropriately characterized described above and, after receiving the necessary approvals, will be transported off-Site for treatment and/or disposal at a permitted facility.

11.3.2 Drilling Cuttings

Drill cuttings generated during the soil boring drilling program and installation of monitoring wells will be contained in 55 gallon drums and then transferred to a 12 cubic yard roll-off, as necessary, and temporarily staged at the Site at a location convenient for transportation to and from the Site. The drill cuttings staged in 55 gallon drums will be moved from drilling locations to the 12 cubic yard roll-off using a skid-steer. The cuttings will be labeled with the borehole identification and the date which the cuttings were initially containerized. This 12 cubic yard roll-off will be stored at a location convenient for transportation to and from the Site. The roll-off will also be covered with a tarp and fastened down when not in use to prevent the volatilization of contamination in the soil, airborne particulate matter (*i.e.*, dust) from wind erosion, collection of rainwater, and the general population from disposing of trash or other material into the container. The final disposition of the cuttings will be identified after the various analytical results from the investigation are available. Depending on the results of the investigation, and one waste characterization sample, it is assumed that various drill cuttings will be transported off-Site for disposal at a permitted facility.

11.3.3 Development and Purge Water

Water generated during this project will be containerized in a 6,900 gallon frac tank except as otherwise noted below. The water will be initially placed into a 55 gallon drum, transported to a central area via use of a skid-steer, and then pumped into the 6,900 gallon frac tank. The water will be temporarily staged at the Site at a location convenient for transportation to and from the Site. The final disposition of the water will be evaluated after the various analytical results from the investigation are available. Depending on the results of the investigation, and waste characterization samples, it is assumed that water will be transported off-Site for disposal at a permitted facility or appropriate permitting obtained for the discharge of the water to the municipal sanitary sewer system with appropriate pre-approval and permit.

If water/fluids are highly contaminated (based on analytical results, visual, and/or olfactory observations) of if NAPL is observed, these water/fluids will be containerized and stored within a separate secondary containment area capable of containing 110% of the volume of the largest container stored in the area. The secondary containment area will be covered with a tarp and/or polysheeting to prevent rain water from collecting.

Development and purge water will initially be containerized in 55 gallon drums (labeled with the date and contents, including well ID) staged near the groundwater monitoring wells.

Following receipt and review of the first round of groundwater sampling analytical results, the purge water may be discharged directly to the ground surface in the vicinity of the respective groundwater monitoring well. This will be dependent on discussion with the NYSDEC Project Manager after the first round of groundwater sampling has been performed. If contamination is present, the staged drums will be transported via skid-steer to the frac tank and then pumped into the frac tank.

11.3.4 Dedicated Sampling Equipment, Personal Protective Equipment (PPE), and General Refuse

Dedicated sampling equipment (*e.g.*, disposable polyethylene bailers, ground plastic, tubing), used PPE, and general refuse associated with the execution of field activities will be containerized in plastic trash bags and disposed of as general refuse in appropriate waste receptacles.

12. FIELD INSTRUMENTS AND CALIBRATION

Field analytical equipment will be calibrated prior to each daily sampling, or more frequently if required. The calibration procedures will conform to manufacturer's standard instructions. Calibration will be conducted in accordance with manufacturer's instructions such that the equipment is functioning within the allowable tolerances established by the manufacturer and required by the project. Instrument calibrations will be documented in the project field book. Records of instrument calibration will be maintained by the Field Team Leader. Copies of the instrument manuals will be maintained on-Site by the Field Team Leader. All changes to instrumentation will be noted in the field log book.

The following field instruments will be used during the investigation:

- Particulate meter;
- PID with 10.6 eV lamp;
- pH probe;
- Specific conductivity probe;
- Temperature probe;
- ORP probe;
- Dissolved oxygen probe; and
- Turbidity probe.

13. ANALYTICAL PROGRAM

13.1 ENVIRONMENTAL SAMPLE ANALYSES

The laboratory samples for each media and the chemical analyses to be performed, including the QA/QC samples are summarized in [Table 5](#) of the RI Work Plan. A more detailed discussion of the analytical methods and procedures is provided in the QCP.

13.2 IDW CHARACTERIZATION

Samples of IDW generated during the investigation will be collected as needed and characterized for disposal based on the requirements of the designated disposal facility.

1. INTRODUCTION

This Quality Control Plan (QCP) has been developed by O'Brien & Gere (OBG) on behalf of the City of Rochester (City) for the Remedial Investigation (RI) at a portion of the former Vacuum Oil Refinery consisting of eight City-owned parcels 1, 13, 31, 69, and 75 Cottage Street; 100 Riverview Place; 102 Violetta Street; and 1320 S. Plymouth Avenue (Site) located in Rochester, New York.

Data gaps remain for the purpose of further evaluating the horizontal and vertical extent of contamination and characterizing surface and subsurface impacts on the Site.

The objective of the RI Work Plan includes, but is not limited to the following;

- Delineation of the horizontal and vertical extent of contamination at the Site;
- Characterization of the surface and subsurface impacts to the Site;
- Identification of the source(s) of contamination, migration pathways, and actual or potential receptors of contaminants;
- Evaluation of the actual or potential threats to public health and environment;
- Production of data of sufficient quantity and quality to support the evaluation of proposed remedial alternatives.

The City has entered the BCP as a Volunteer, and as such, the delineation and extent of off-Site contamination is not required; however, the contaminants migrating off-Site, the location(s), and environmental media will be evaluated.

Additional RI Work Plan Addenda will be prepared and implemented, as needed, to achieve the objectives of the RI.

The information will be used to identify if remedial measures are necessary and to allow for future redevelopment of the Site to occur.

This QCP presents the investigation objectives and quality assurance/quality control (QA/QC) activities and associated work efforts associated with sampling and analysis of environmental samples at the Site. The procedures in this QCP are designed to be followed by personnel participating in the field investigation and in the laboratory analyses of environmental samples and the data validation performed on the samples.

2. PROJECT BACKGROUND AND DESCRIPTION

This section presents the project Site location, description, and brief Site history.

2.1 PROJECT BACKGROUND

The Site is located at 1, 13, 31, 69, and 75 Cottage Street; 100 Riverview Place; 102 Violetta Street; and 1320 S. Plymouth Avenue in Rochester, Monroe County, New York and encompasses approximately 15.4 acres.

The Site is bordered by the Genesee River to the east/southeast/south beyond a narrow strip of New York State-owned land, residential property to the west, vacant land (formerly a junkyard addressed as 15 Flint Street) to the northwest, and Flint Street with commercial land to the north across Flint Street. Vacant land addressed as 5 Flint Street and containing a single, three-story building is also located near the north end of the Site. Although 5 Flint Street is located on the northern side of the Site, the Site also wraps around 5 Flint Street in a “U” shape.

The Site was historically operated as a part of a petroleum refinery blending and bulk oil storage facility from approximately 1866 to 1930. Crude oil, kerosene, naphtha, finished lubricants, and containers for these products (*e.g.*, wooden barrels, tin cans, and drums) were manufactured and stored on Site. Operations and facilities that formerly occupied the Site include former canal beds, rail yard including tank car use and cleaning, barrel manufacturing plant, numerous storage areas, and underground facilities that previously serviced Site operations (*e.g.*, utilities, sewers, and piping).

While most of the abovegrade structures have been demolished and removed, some remnants of former structures remain. It is unknown as to what subsurface structures remain. Based on historic aerial photographs, the structures were removed sometime between 1926 and 1958. An asphalt-paved bicycle/walking path runs through the entire eastern side of the Site from the north end of the property to the south of the property and beyond in both directions. An approximate 1.2 acre grass-covered area is located on the eastern boundary of the Site along the Genesee River. The rest of the Site is undeveloped (with the exception of the historic items mentioned above) and consists of wooded and vegetative areas.

Subsurface environmental investigations were conducted at the Site by ExxonMobil in 2008 to evaluate surface soil, subsurface soil, and groundwater conditions. These investigations were conducted on approximately 27 acres of the Vacuum Oil Site and included properties owned by both the City (approximately 15.4 acres) and private individuals. The investigations identified the presence of volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), metals, and polychlorinated biphenyls (PCBs) in both soil and groundwater.

The Site was subsequently entered into the Brownfield Cleanup Program on April 6, 2015 as Site No. C828190.

2.2 PROJECT SCOPE

Data gaps remain for the purpose of further evaluating the horizontal and vertical extent of contamination and characterizing surface and subsurface impacts on the Site.

The objective of the RI Work Plan includes, but is not limited to the following;

- Delineation of the horizontal and vertical extent of contamination at the Site;
- Characterization of the surface and subsurface impacts to the Site;
- Identification of the source(s) of contamination, migration pathways, and actual or potential receptors of contaminants;
- Evaluation of the actual or potential threats to public health and environment;
- Production of data of sufficient quantity and quality to support the evaluation of proposed remedial alternatives.

The City has entered the BCP as a Volunteer, and as such, the delineation and extent of off-Site contamination is not required; however, the contaminants migrating off-Site, the location(s), and environmental media will be evaluated.

Additional RI Work Plan Addenda will be prepared and implemented, as needed, to achieve the objectives of the RI.

The information will be used to identify if remedial measures are necessary and to allow for future redevelopment of the Site to occur.

Sampling locations are presented in the RI Work Plan.

2.2.1. Laboratory Analysis

The surface soil, subsurface soil, soil vapor, and overburden and bedrock groundwater samples will be submitted to ALS located in Rochester, New York for the analyses listed in [Table 2-1](#). ALS is an Environmental Laboratory Approval Program (ELAP)-certified and National Environmental Laboratory Accreditation Program/Conference (NELAP)-certified laboratory (Certification Number 10145).

[Table 2-1](#) presents the analytical methods, sample collection containers and volumes, preservation, holding times, and associated quality control sample frequency.

The target analytes are listed in [Table 2-2A](#), [Table 2-2B](#), [Table 2-2E](#), [Table 2-3A](#), [Table 2-3B](#), [Table 2-4A](#), [Table 2-4B](#), [Table 2-5A](#), [Table 2-5B](#), [Table 2-6A](#), and [Table 2-6B](#).

The QC requirements and corrective actions listed in [Tables 2-6](#) through [2-11](#), which supplement the method requirements, are to be followed by the laboratory.

ALS will perform the analyses for this project and will be responsible for the quality control of the data reported for this project.

ALS will evaluate non-detected results for surface soil, subsurface soil, soil vapor, and overburden and bedrock groundwater to the method detection limits (MDLs) and report the non-detected results referencing the quantitation limit (QL).

The QL concentration is established by the lowest standard in the instrument calibration. For the remaining data, results that are less than the QLs but greater than or equal to the MDLs will be reported using the "J" flag. For example, for a target analyte with a QL of 10 micrograms per liter ($\mu\text{g}/\text{L}$) and an MDL of 2 $\mu\text{g}/\text{L}$, a non-detected result is reported as 10 $\mu\text{g}/\text{L}$ "U", indicating that a concentration greater than or equal to the MDL was not detected by the laboratory. A detected concentration of 6 $\mu\text{g}/\text{L}$ is reported as 6 "J" and a detected concentration of 23 $\mu\text{g}/\text{L}$ is reported without a laboratory flag. The laboratory must include both QLs and MDLs on the sample result sheet reported to the data user.

Where applicable, the QLs and MDLs listed in [Table 2-2A](#), [Table 2-2B](#), [Table 2-2E](#), [Table 2-3A](#), [Table 2-3B](#), [Table 2-4A](#), [Table 2-4B](#), [Table 2-5A](#), [Table 2-5B](#), [Table 2-6A](#), and [Table 2-6B](#), or the most recent MDLs and QLs, will be reported by the laboratory.

The laboratory will provide sample containers for the investigation, prepared in accordance with method requirements.

Communications with the Consultant or City personnel will be documented by the laboratory in the data packages.

The analytical data will be reported in NYSDEC Analytical Services Protocol (ASP) Category B deliverable format, including the forms described in the NYSDEC guidance, in both hardcopy and electronic data format.

2.2.2. Data Validation

Following completion of investigation activities and receipt of final laboratory data, data validation will be performed in accordance with this QCP applying current NYSDEC Data Usability Summary Report (DUSR) guidance.

2.2.3. Documentation

Laboratory analytical data will be provided in electronic data deliverable (EDD) format, in accordance with the laboratory's internal protocol for deliverable requirements for electronic data. NYSDEC requires that all data submitted to the Department of Environmental Remediation (DER) must be in a NYSDEC-approved EDD. The EDD will be submitted within 90 days of receipt of validated laboratory analytical data.

Associated data validation qualifiers will be manually entered into a spreadsheet by the validator and then imported into EQUiS™ by OBG prior to NYSDEC submission.

Electronic records will be incorporated into the final project files for the samples. The field logs, data packages, and records will be included in the project files, which will be archived by the Consultant for a period of ten years.

3. DATA QUALITY OBJECTIVES AND CRITERIA

The Data Quality Objective (DQO) Process, as it has been applied to this RI, comprises the following steps, consistent with guidance presented in the United States Environmental Protection Agency (USEPA) Guidance for the Data Quality Objectives Process (EPA QA/G-4), February 2006. The DQO process establishes the acceptance criteria, which serve as the basis for collecting data of sufficient quality and quantity to support the goals of the project activities.

3.1. DQO PROCESS

The process consists of the following seven iterative steps for the DQO process:

- 6) **Step 1** - State the Problem – Additional investigations are required to evaluate the extent of contamination in surface soil, subsurface soil, soil vapor, and overburden and bedrock groundwater for the purpose of evaluating remedial options that are consistent with its future use.
- 7) **Step 2** - Identify the Goal of the Study –
 - » Evaluate the presence, concentrations, and extent of VOCs, SVOCs, metals, PCBs, and pesticides in surface soil, subsurface soil, soil vapor, and overburden and bedrock groundwater.
 - » Evaluate potential receptors and exposure pathways of contaminants that are present at the Site
- 8) **Step 3** - Identify information inputs (the data types that will be required before project decisions can be made) - The primary required data types will be analytical results from surface soil, subsurface soil, soil vapor, and overburden and bedrock groundwater results from the Site.
- 9) **Step 4** - Define the Boundaries of the Study (the spatial and temporal features pertinent for decision making).
- 10) **Step 5** - Develop the analytic approach (how will the study results be analyzed and conclusions made from the data) - Based on the results of previous investigations, additional RI activities are necessary to fill the data gaps that remain to fully characterize the Site.
- 11) **Step 6** - Specify performance or acceptance criteria (performance or acceptance criteria that the collected data will need to achieve) - Data must be of known quality relative to its intended purpose. Completeness is the measure of the amount of valid data obtained from a measurement system compared to the amount expected to be obtained under normal conditions. If the completeness objective of 95 percent is not met, additional sampling may be justified.

- 12) Step 7** - Develop the plan for obtaining data - The surface soil, subsurface soil, soil vapor, overburden and bedrock groundwater samples will be collected and analyzed as described in the Work Plan and this QCP.

The following remediation criteria will be utilized to evaluate data from the sampling events:

- Surface and subsurface soil data will be compared to one or more applicable values, including, but not limited to the following:
 - » Unrestricted Use Soil Cleanup Objectives (SCOs) referenced in the NYSDEC General Remedial Program Requirements, presented in the New York State Codes, Rules and Regulations; Title 6, Chapter IV, Subpart 375 (Part 375), Table 375-6.8(a), dated December 14, 2006;
 - » Residential Use SCOs referenced in Part 375, Table 375-6.8(b);
 - » Restricted Residential Use SCOs referenced in Part 375, Table 375-6.8(b);
 - » Protection of Groundwater SCOs referenced in Part 375, Table 375-6.8(b);
 - » Protection of Ecological Resources SCOs referenced in Part 375, Table 375-6.8(b);
 - » Residential Use Supplemental SCOs (SSCOs) referenced in the NYSDEC Commissioners Policy/51 (CP-51) Soil Cleanup Guidance Document, Table 1, issued October 21, 2010;
 - » Restricted Residential Use SSCO referenced in CP-51 Table 1;
 - » Protection of Groundwater SSCO referenced in CP-51 Table 1; and
 - » Protection of Ecological Resources SSCO referenced in CP-51 Table 1.
- Overburden and bedrock groundwater data will be compared to applicable values provided in the New York State Ambient Water Quality Standards and Guidance values, referenced in Table 1 of the NYSDEC Division of Water Technical and Operational Guidance Series 1.1.1 document titled Ambient Water Quality Standard and Guidance Values and Groundwater Effluent Limitations (TOGS 1.1.1) dated June 1998 (as amended by addendum dated April 2000 and June 2004). Overburden and bedrock groundwater will be compared to the class "GA."

4. PROJECT ORGANIZATION AND RESPONSIBILITY

The consultant will be responsible for project management, sample collection, data validation and data reporting. ALS will perform sample analyses for surface soil, subsurface soil, soil vapor, and overburden and bedrock groundwater. Responsibilities for key project team members are summarized below.

4.1. REGULATORY AGENCY AND CLIENT KEY PERSONNEL

4.1.1. NYSDEC PROJECT MANAGER

Mr. Frank Sowers is the NYSDEC Project Manager for the Site. As such, he will be responsible for reviewing submissions and overseeing project activities on behalf of NYSDEC.

4.1.2. CITY PROJECT MANAGER

Mr. Joseph Biondolillo is the City Project Manager for the Site. As such, he will be responsible for reviewing submissions and overseeing project activities.

4.2. CONSULTANT KEY PERSONNEL

4.2.1. Consultant Project Officer

The Consultant Project Officer will be Doug Crawford and has overall responsibility for meeting the stated project objectives. In addition, he is responsible for providing the Project Manager with access to consultant resources.

4.2.2. Consultant Project Manager

The Consultant Project Manager will be Deborah Wright and is responsible for implementing the project and has the authority to commit the resources necessary to meet project objectives and requirements. The primary function of the Project Manager is to meet the technical, financial, and scheduling objectives and will provide direction to Project Team.

4.2.3. QA Officer

The QA Officer (QAO) for this project will be Karen Storne and will manage and be responsible for QA/QC review of data generated during the sample collection activities. Data processing and validation will be overseen and reviewed by the Consultant QAO. If QA problems or deficiencies requiring special action are identified, the Consultant QAO, Project Manager, and Project Officer will determine the appropriate corrective action. The QAO will then be responsible for follow-up and oversight of corrective action implementation, to the satisfaction of IFR Development and the NYSDEC.

The QAO may perform data validation activities or designate additional data validators to work under their direction. Data validators will be responsible for review of laboratory data for compliance with the project-specific DQOs and for such parameters as precision, accuracy, representativeness, comparability, sensitivity and completeness. Data validators will notify the QAO of any major QA deficiencies.

4.2.4. Field Investigation Manager

The Field Investigation Manager, Anthony DiNardo, will be responsible for directing and coordinating the day-to-day activities while field activities are underway.

The Field Investigation Manager's responsibilities include:

- Communicate and coordinate with the City and the laboratory prior to sample collection and during shipment of sample coolers to the laboratory;
- Develop and implement field-related sampling plans and schedule;
- Coordinate and manage field staff;
- Supervise or act as the field sample custodian;
- Implement QC for technical data, including field measurements;

- Adhere to work schedules;
- Coordinate and oversee technical efforts of subcontractors assisting the field team;
- Identify problems at the field team level and resolve difficulties; and
- Implement and document corrective action procedures.

4.2.5. Field Sampling Personnel

Field sampling personnel will be responsible for collection, packaging, preservation, and shipping of environmental samples in accordance with the QCP and applicable NYSDEC requirements. Field sampling personnel will also collect field data and monitor Site health and safety. Mr. Dennis Peck, City Division of Environmental Quality (DEQ) Technician, will assist O'Brien & Gere field sampling personnel with several tasks.

4.2.6. Health and Safety Coordinator

The Health & Safety Coordinator will be responsible for monitoring Site health and safety during the sampling events.

4.3. LABORATORY MANAGEMENT

ALS will analyze surface soil, subsurface soil, soil vapor, and overburden and bedrock groundwater samples collected during the sampling activities and submitted for the majority of the analyses.

The laboratory shipping addresses and National Environmental Laboratory Accreditation Conference (NELAC) Certification numbers are as follows: #10145.

4.3.1. Laboratory Project Manager

Ms. Janice Jaeger is the Laboratory Project Manager for ALS. The Laboratory Project Manager will be responsible for:

- Coordinating laboratory analysis;
- Supervising in-house chain-of-custody documents;
- Scheduling sample analysis;
- Overseeing data review; and
- Overseeing preparation of analytical reports.

It will be the responsibility of the Laboratory Project Manager to approve final analytical reports prior to submission to the consultant.

5. CHAIN-OF-CUSTODY AND SAMPLING HANDLING PROCEDURES

5.1. FIELD AND LABORATORY CUSTODY PROCEDURES

Chain-of-custody procedures will be instituted and followed throughout the investigation. These procedures include field custody, laboratory custody, and evidence files. Samples are physical evidence and will be handled according to strict chain-of-custody protocols. The QAO must be prepared to produce documentation that traces the samples from the field to the laboratory and through analysis. USEPA has defined custody of evidence as follows:

- In actual possession;
- In view after being in physical possession;
- In a locked laboratory; and
- In a secure, restricted area.

5.2. SAMPLE CONTAINERS AND FIELD STORAGE

ALS will supply appropriate sample containers for surface soil, subsurface soil, soil vapor, and overburden and bedrock groundwater samples in coolers as well as preservatives (as presented in [Table 2-1](#)). QA measures for these samples will begin with the sample containers; pre-cleaned containers will be purchased from a USEPA-certified manufacturer (I-Chem 200 or equivalent).

Immediately after collection, samples will be transferred to properly labeled sample containers, and properly preserved. [Table 2-1](#) lists the proper sample container, sample volumes, preservation, and holding times.

Samples requiring refrigeration for preservation will be promptly transferred to coolers packed with wet ice and/or ice packs. If field storage is required, the samples will be stored in a secured storage facility and a cooler temperature of $4\text{ }^{\circ}\text{C} \pm 2\text{ }^{\circ}\text{C}$ will be maintained.

5.3. FIELD DOCUMENTATION

The field sampler is personally responsible for the care and custody of the sample until transferred.

The field logbook will be used to note information regarding collection of samples and any observations. All entries will be signed and dated. Field logbooks will be waterproof and bound. The logbook will be dedicated to the project and pages will not be removed. Corrections will be made by drawing a single line through the incorrect data and initialing and dating the correction that was made to the side of the error. An initialed diagonal line will be used to indicate the end of an entry or the end of the day's activities.

The following information will be recorded in the field logbook by the field sampling team:

- Name and title of author, date, and time of site entry, and physical/environmental conditions during the field activity;
- Project number, client name, and Site name;
- Name and title of field crew members;
- Sample media;
- Sample collection method, including equipment utilized;
- Number and volume of samples collected;
- Description of sample locations;
- Date and start and end time of sample collection;
- Diagrams of sampling process;
- Sample and QA/QC identification numbers;

- Sample distribution;
- Field observations;
- Field measurements made and equipment used;
- Calculations, results, and calibration data for field sampling and measurements;
- References for maps and photographs of the sample location;
- Bottle lot numbers; and
- Dates and method of sample shipments.

A completed sample identification label or tag that will be sequentially numbered, will be attached to each investigative or QC sample and the sample placed in a shipping container. The identification on the label/tag must be sufficient to enable cross-reference with the logbook. The sample label/tag will be recorded using waterproof, non-erasable ink and will be attached to the sample container using adhesive.

The sample labels/tags will contain the following information:

- Sample location/number identification;
- Site/Project name;
- Date and time of sample collection;
- Designation of the sample as a grab or composite;
- Type of sample matrix;
- Name/initials of the sampler;
- Whether the sample is preserved or unpreserved;
- Space for laboratory sample number (only on the sample tag); and
- General types of analysis to be performed.

5.4. FIELD CUSTODY PROCEDURES AND DOCUMENTATION

For surface soil, subsurface soil, soil vapor, and overburden and bedrock groundwater samples, chain-of-custody records will be kept starting at the time that sample containers are placed in the coolers for transportation to the laboratory. One completed chain-of-custody record must be kept with each sample cooler at all times. Example chain-of-custody forms are provided in the laboratory's Quality Assurance Manual (QAM).

The following measures will be taken when completing a chain-of-custody record:

- Chain-of-custody forms will be completed in waterproof, non-erasable ink;
- Chain-of-custody forms will be completed neatly using printed text. If a simple mistake is made, the error will be lined out with a single line and initialed and dated;
- Each separate sample entry will be sequentially numbered;
- The use of "Ditto" or quotation marks to indicate repetitive information in columnar entries should be avoided. If numerous repetitive entries must be made in the same column, a continuous vertical arrow will be used between the first entry and the next different entry;
- When more than one chain-of-custody form is used for a single shipment, each form will be consecutively numbered using the "Page ___ of ___" format;
- If necessary, additional instructions will be placed directly onto the chain-of-custody form; and
- Acronyms used on a chain-of-custody form will be defined.

For surface soil, subsurface soil, soil vapor, and overburden and bedrock groundwater samples, the chain-of-custody form will contain the following information:

- Project identification and number;
- Sample description/location;
- Required analysis;
- Date and time of sample collection;
- Type and matrix of sample;
- Number of sample containers;
- Analysis requested/comments;
- Sampler signature/date/time;
- Date and signature of the field representative;
- Date and signature of the laboratory representative;
- Carrier used to ship coolers; and
- Air bill number (if shipped by a commercial carrier).

In the case that high concentrations are suspected to be present in the samples, a note to that effect will be included on the chain-of-custody form.

Environmental samples will be packed prior to shipment using the following procedures (where applicable):

- Select a sturdy cooler in good repair and clean. Secure and tape the drain plug with fiber or duct tape.
- Be sure the lids on all bottles are tight (will not leak) and baggies are sealed.
- Where applicable, add ice that has been placed in heavy-duty polyethylene bags and properly sealed on top of or between the samples. Pack samples securely to eliminate breakage during shipment with ice packs to maintain the inside temperature at approximately $4\text{ }^{\circ}\text{C} \pm 2\text{ }^{\circ}\text{C}$.
- Sampling containers will be packed with packing materials. When possible, sample container preparation and packing for shipment will be completed in a well-organized and clean area. Sample containers will be prepared for shipment by wiping containers clean of debris/water using paper towels. Paper towels will be disposed with the personal protective equipment (PPE).
- Place chain-of-custody record into a Ziploc® plastic bag, tape the bag to the inner side of the cooler lid, and close the cooler and securely tape (preferably with fiber tape) the top of the cooler shut. Two custody seals will be affixed to the latch and lid of the cooler. The number of the security seal will be recorded on the chain-of-custody form. The custody seals will consist of adhesive-backed tape that easily rips if it is disturbed. The field sampler will initial and date the seal. The seals must be broken to open the cooler and will indicate tampering if the seal is broken before receipt at the laboratory.
- A label containing the name and address of the shipper will be placed on the outside of the container.

5.5. SAMPLE TRANSPORTATION

ALS will provide a laboratory courier for sample pick up at the Site. Prior to shipment of sample coolers, the field sampling team will contact the laboratory to notify the laboratory of the shipment.

Samples will remain in the custody of the sampler until transfer of custody is completed. Transfer consists of:

- Delivery of samples to the client or Laboratory Sample Custodian; and/or
- Signature of the Laboratory Sample Custodian on the chain-of-custody form as receiving the samples and signature of sampler as relinquishing the samples.

The field sampling team will hand deliver coolers or arrange for laboratory courier pick up at the Site.

The chain-of-custody document will be completed by the field sampler and provided for each sample cooler or box. When transferring the possession of samples, individuals relinquishing and receiving will sign, date, and note the time on the chain-of-custody. Custody of samples must be continuous between parties and time gaps must not be present. Each shipment of samples to the laboratory must have its own chain-of-custody record with the contents of the shipment, method of shipment, name of courier, and other pertinent information written on the record. The original record accompanies the shipment and the copies are kept with the field logbook and distributed to the Consultant Project Manager. The laboratory will be notified daily of each sample shipment.

Samples must be sent to the laboratory as soon as practicable. Generally, samples should be received by the laboratory within 72 hours of sampling.

5.6. LABORATORY CUSTODY PROCEDURES

Laboratory custody procedures continue when the samples are received by the laboratory. When the samples arrive at the laboratory, the Laboratory Sample Custodian will note the cooler temperature on the chain-of-custody form, where applicable. If the cooler temperature is greater than 6 °C, the Consultant Project Manager will be notified.

The Laboratory Sample Custodian's duties and responsibilities upon sample receipt will be to:

- Document receipt of samples by signing the record with the date and time of sample receipt;
- Note the cooler temperature on the chain-of-custody form;
- Inspect sample shipping containers for the presence or absence of custody seals (only if shipped via overnight courier) and for container integrity;
- Sign the appropriate forms or documents, verify, and record the agreement or disagreement of information on sample documents and, if there are discrepancies, record the problem and notify the Consultant Project Manager;
- Assign a number for each sample upon receipt. That sample number will be placed on the sample label which will remain attached to the sample container;
- Log sample information into the laboratory sample tracking system;
- Label sample with a unique, sequential laboratory sample number; and
- Place samples in the walk-in cooler or sample storage area that is a secure, limited-access storage.

If QC samples have not been properly identified during sample collection, the Laboratory Project Manager will contact the Consultant Project Manager to assign QC samples prior to the start of sample analysis.

The laboratory will immediately contact the Consultant Project Manager if issues pertaining to sample condition or documentation are detected (*e.g.*, broken security seal; broken, open, or otherwise compromised sample containers; chain-of-custody information in disagreement with sample labels).

5.7. FINAL EVIDENCE FILES

The final evidence file will be the central repository for documents that constitute evidence relevant to sampling and analysis activities as described in this QCP. Consultant is the custodian of the evidence file and maintains the contents of evidence files for the Site, including relevant records, reported, logs, field notebooks, pictures, subcontractor reports, and data reviews.

Copies of the laboratory data packages will be stored by the laboratory for incorporation into the sample file. The Laboratory Project Manager will be responsible for laboratory data packages.

Upon completion of the analyses, the Consultant Project Manager will begin assimilating the field and laboratory data. In this way, the file for the samples will be generated. The final file for the sample will be stored by the Consultant and will consist of the following:

- Laboratory data packages, including summary and raw data from the analysis of environmental and QC samples, chromatograms, mass spectra, calibration data, work sheets, and sample preparation log;
- Chain-of-custody records;
- Data validation reports;
- Field notebooks and data;
- Field collection report;
- Pictures and drawings, if applicable;
- Progress and QA reports;
- Contractor and subcontractor reports; and
- Correspondence.

The evidence file must be maintained in a secured, limited access area until submittals for the project have been reviewed and approved, and for a minimum of 10 years past the submittal date of the final report.

6. LABORATORY SAMPLE STORAGE AND HANDLING

At the laboratory, the analysts will be required to log samples and extracts in and out of storage as the analysis proceeds.

There must not be a lapse in the custody for the sample containers and exchanges of custody must be documented on the form. Samples will be returned to secure storage at the close of business. Care must be exercised to properly complete, date, and sign records needed to generate the data package.

Procedures to be followed by the laboratory include:

- Samples will be handled by the minimum number of people possible;
- The laboratory will set aside a secured sample storage area consisting of a clean, dry, refrigerated, isolated room;
- A specific person will be designated sample custodian. Incoming samples will be received by the custodian who will indicate receipt by signing the chain-of-custody form;
- The custodian will ensure that samples which are heat-sensitive, light-sensitive, radioactive, or which require special handling in other ways, are properly stored and maintained prior to analysis;
- The analytical area will be restricted to authorized personnel only; and
- After sample analyses are complete, the analytical data will be kept secured and released to authorized personnel only.

7. ANALYTICAL METHODS, TARGET ANALYTES AND REGULATORY CRITERIA

Table 2-2A, Table 2-2B, Table 2-2E, Table 2-3A, Table 2-3B, Table 2-4A, Table 2-4B, Table 2-5A, Table 2-5B, Table 2-6A, and Table 2-6B present the analytical methods, target analytes, detection limits and regulatory criteria for the sampling activities.

7.1. ANALYTICAL METHODS AND LABORATORY ANALYSIS

To obtain data of a quality sufficient to meet the project DQOs, the following methods will be used for analysis of the samples collected for the RI, if the analyses are identified in the RI Work Plan:

- VOCs and SVOC analyses by gas chromatography/mass spectrometry (GC/MS);
- PCBs by GC;
- Metals by inductively coupled plasma (ICP);
- Pesticides by GC;
- Mercury by cold-vapor atomic absorption; and
- Total cyanide by colorimetric technique.

The laboratory will adhere to the specific analyses and QA/QC requirements in the analytical methods listed in **Table 2-1** and additional requirements listed in this QCP. The most recent laboratory control limits for accuracy and precision, will be used to evaluate the sample data. In addition, the QC requirements and corrective actions listed in **Tables 2-6 to 2-11**, which augment the method requirements, will be followed by the laboratory.

In the event of an analytical system failure, the Laboratory Project Manager will identify the situation and provide corrective action guidance. The Consultant QAO will be notified and the situation will be documented in the data package case narrative.

Matrix interferences will be identified and documented during the analytical process. Samples may be diluted only if analytes of concern generate responses in excess of the linear range of the instrument. MDLs and QLs may only be achieved in an undiluted sample free of matrix interferences or of high concentrations of target analytes. If matrix interferences are encountered or if high concentrations of target compounds are present, established MDLs and QLs may not be achievable without impacting the instrument quality. If the laboratory has taken appropriate actions and matrix interferences prevent the laboratory from achieving the specified detection limits, the Consultant QAO will be contacted as soon as the situation is identified. The Laboratory Project Manager will document, in the data package case narrative, how the laboratory demonstrated good analytical practices in order to attempt to achieve the specified reporting detection limits.

Blanks will not be subtracted from target analyte results.

The generated data will be input into the laboratory database management system.

Complete descriptions of analytical procedures to be used in the laboratory are described in the methods, the QC requirements and corrective actions listed in this QCP and the laboratory SOPs. The laboratory SOPs and QAM are available upon request.

7.2. TARGET ANALYTES AND DETECTION LIMITS

The MDL is defined as the minimum concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero and is determined from analysis of a sample in a given matrix containing the analyte. The QL is the lowest concentration that can be reliably quantified within specified limits of precision and accuracy during routine laboratory operations.

ALS will evaluate non-detected results for surface soil, subsurface soil, soil vapor, and overburden and bedrock groundwater to the MDLs and report the non-detected results referencing the QL. The QL concentration is established by the lowest standard in the instrument calibration.

For the remaining data, results that are less than the QLs but greater than or equal to the MDLs will be reported using the "J" flag. For example, for a target analyte with a QL of 10 µg/L and an MDL of 2 µg/L, a non-detected result is reported as 10 µg/L "U", indicating that a concentration greater than or equal to the MDL was not detected by the laboratory. A detected concentration of 6 µg/L is reported as 6 "J" and a detected concentration of 23 µg/L is reported without a laboratory flag. The laboratory must include both QLs and MDLs on the sample result sheet reported to the data user.

The QLs and MDLs listed in [Table 2-2A](#), [Table 2-2B](#), [Table 2-2E](#), [Table 2-3A](#), [Table 2-3B](#), [Table 2-4A](#), [Table 2-4B](#), [Table 2-5A](#), [Table 2-5B](#), [Table 2-6A](#), and [Table 2-6B](#), or the most recent MDLs and QLs, will be reported by the laboratory on the sample result sheets. Laboratories periodically update the MDL and QL values as part of internal laboratory policy.

The lowest calibration standard will establish the QLs for the target analytes that will be reported by the laboratory.

7.3. REGULATORY CRITERIA

[Table 2-2A](#), [Table 2-2B](#), [Table 2-2E](#), [Table 2-3A](#), [Table 2-3B](#), [Table 2-4A](#), [Table 2-4B](#), [Table 2-5A](#), [Table 2-5B](#), [Table 2-6A](#), and [Table 2-6B](#) present the applicable regulatory criteria which will be used to evaluate analytical data for the sampling activities. The following remediation standards are applicable to the RI activities and will be utilized to evaluate data from the sampling events:

- Surface and subsurface soil data will be compared to one or more applicable values, including, but not limited to the following:
 - » Unrestricted Use Soil SCOs in Part 375;
 - » Residential Use SCOs referenced in Part 375, Table 375-6.8(b);
 - » Restricted Residential Use SCOs referenced in Part 375, Table 375-6.8(b);
 - » Protection of Groundwater SCOs referenced in Part 375, Table 375-6.8(b);
 - » Protection of Ecological Resources SCOs referenced in Part 375, Table 375-6.8(b);
 - » Residential Use SSCOs referenced in CP-51 Table 1;
 - » Restricted Residential Use SSCOs referenced in CP-51 Table 1;
 - » Protection of Groundwater SSCOs referenced in CP-51 Table 1; and
 - » Protection of Ecological Resources SSCOs referenced in CP-51 Table 1.
- Overburden and bedrock groundwater data will be compared to applicable values provided in the New York State Ambient Water Quality Standards and Guidance values, referenced in Table 1 of TOGS 1.1.1. Overburden and bedrock groundwater will be compared to the class "GA" source of drinking water values.

8. QUALITY CONTROL REQUIREMENTS AND MEASUREMENT PERFORMANCE CRITERIA

The overall effectiveness of a QA/QC program depends on operating in the field and laboratory according to a program that systematically ensures the precision and accuracy of analyses by detecting errors and preventing their recurrence or measuring the degree of error inherent in the methods applied.

Quality Assurance is an integrated system of activities involving planning, quality assessment, reporting and quality improvement to ensure that a program meets defined standards of quality with a stated level of confidence. Quality Control involves the technical activities that measure the quality of a program so that it meets the needs of users.

The following sections describe the QC checks that will be utilized in the field and laboratory during this project.

8.1. LABORATORY QA/QC CHECKS

Tables 2-2C, 2-2D, and 2-6 to 2-11 summarize the laboratory QC checks, frequency of analysis, control limits, and laboratory corrective actions for the analytical method to be used in this project. A brief description of laboratory QA/QC analyses is presented in the following subsections.

8.1.1. GC/MS Tuning

Tuning and performance criteria are established to verify mass resolution, identification, and to some degree, instrument sensitivity. These criteria are not sample specific; conformance is determined using standard materials. Therefore, these criteria should be met in all circumstances.

8.1.2. Calibration

Compliance requirements for satisfactory instrument calibration are established to verify that the instrument is capable of producing acceptable quantitative data. Initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of analysis, and continuing calibration and performance checks document satisfactory maintenance and adjustment of the instrument on a day-to-day basis.

8.1.3. Blanks

Several types of blanks will be analyzed by the laboratory. Corrective action procedures will be implemented for blank analyses if target compounds are detected at concentrations greater than the applicable criteria. The criteria for evaluation of blanks apply to any blank associated with a group of samples collected, prepared and/or analyzed at the same time, where applicable. If problems with a blank exist, data associated with the project must be carefully evaluated to determine whether or not there is an inherent variability in the data for the project, or if the problem is an isolated occurrence not affecting other data.

For surface soil, subsurface soil, soil vapor, and overburden and bedrock groundwater samples, a method blank is an analyte-free blank that undergoes the preparation procedures applied to a sample. These samples are analyzed to examine whether sample preparation and analysis techniques result in sample contamination. The laboratory will prepare and analyze a method blank with each group of samples that are extracted, digested, or analyzed at the same time.

Field blanks are analyzed to assess contamination introduced during field sampling procedures and sample shipment. Field blank collection begins with two sets of identical bottles; one set filled with target analyte-free water provided by the laboratory, and one empty set of bottles identical to those provided for aqueous sample collection. At the field location, the water is passed from the full set of bottles directly into the empty set of bottles. This will constitute identical bottle to bottle transfer. The field blank samples will be subject to the same analyses as the environmental samples. One field blank will be collected during each sampling event.

Equipment blanks are analyzed to assess contamination introduced during field sampling procedures when equipment is reused following decontamination. Equipment blank collection begins with two sets of identical bottles; one set filled with target analyte-free water provided by the laboratory, and one empty set of bottles identical to those provided for aqueous sample collection.

At the field location, in an area suspected to be contaminated, the water is passed from the full set of bottles through the field-decontaminated sampling device(s) and into the empty set of bottles. This will constitute identical bottle to bottle transfer.

The equipment blank samples will be subject to the same analyses as the environmental samples. For surface soil and subsurface soil, one equipment blank will be collected per 20 samples. For overburden and bedrock groundwater, one equipment blank will be collected per 20 samples. Equipment blanks are not necessary for soil vapor samples.

Trip blanks will be prepared and submitted for VOC analysis with field samples and will contain analyte-free water or preservative, as appropriate. A trip blank will be prepared by the laboratory, using the same preservation technique as that used to prepare the sample containers, from the same source as the method blank water, and sent to the Site in the cooler with the other sample containers. The trip blank will undergo shipment from the sampling site to the laboratory in coolers with the environmental samples to be analyzed for VOCs. Trip blanks will be analyzed for VOCs to determine if contamination has taken place during sample handling and/or shipment. Trip blanks will be included in sample coolers at a frequency of one trip blank per shipment.

8.1.4. Internal Standards Performance

Internal standards, which are compounds not found in environmental samples, will be spiked into samples, blanks, MS/MSDs, and laboratory control samples (LCSs) at the time of sample preparation. Internal standards must meet retention time and performance criteria specified in the analytical method or the sample will be reanalyzed.

8.1.5. Surrogate Recovery

Accuracy and matrix biases for individual samples are monitored for organic analyses using surrogate additions. Surrogates are compounds similar in nature to the target analytes; the surrogates are spiked into aqueous and solid samples, blanks, and QC samples prior to sample preparation for organic analyses. The evaluation of the results of these surrogate spikes is not necessarily straightforward. The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Since the effects of the sample matrix are frequently outside the control of the laboratory and may present relatively unique problems, the review and validation of data based on specific sample results is frequently subjective.

8.1.6. Laboratory Control Samples

LCSs are standard solutions that consist of known concentrations of the complete list of target analytes spiked into laboratory analyte-free water or sand. They are prepared or purchased from a certified manufacturer from a source independent from the calibration standards to provide an independent verification of the calibration procedure. These QC samples are then prepared and analyzed following the same procedures employed for environmental sample analysis to assess method accuracy independently of sample matrix effects. The laboratory will prepare and analyze a LCS with each group of samples of similar matrix that are extracted, digested, or analyzed at the same time. For VOC analysis, one LCS will be analyzed with each analytical sequence in a 12-hour period for each matrix. Percent recoveries will be evaluated to assess the efficiency of the preparation and analysis method independent of sample matrix effects.

8.1.7. MS/MSD Samples

MS/MSD data are generated to determine long-term precision and accuracy of the analytical method with respect to sample matrices. Generally, the MS/MSD data alone are not used to evaluate the precision and accuracy for associated organic samples since data may reflect specific matrix effects only present within one sample.

One set of MS/MSD samples will be collected for every 20 samples per matrix (minimum frequency of 5%) or one per matrix for less than 20 samples. If less than 20 samples are collected, one MS/MSD set will be collected. Whenever possible, MS/MSD samples will be prepared and analyzed within the same batch as the environmental samples. MS/MSD samples will be spiked at the laboratory with the complete list of target analytes.

8.1.8. Compound Identification and Quantitation

The objective of the qualitative criteria is to minimize the number of erroneous identifications of compounds.

An erroneous identification can either be a false positive (reporting a compound present when it is not) or a false negative (not reporting a compound that is present). The identification criteria can be applied much more easily in detecting false positives than false negatives. Negatives, or non-detect compounds on the other hand, represent an absence of data and are therefore much more difficult to assess. The objective for quantitative requirements is to maximize the accuracy of data and sensitivity of the instrument. Unless sample screening indicates the presence of high concentration target analytes, samples will be analyzed undiluted to maximize sensitivity. Samples must be reanalyzed at the appropriate dilution when concentrations exceed the linear calibration range to maximize accuracy. Matrix interferences will be identified and documented. Samples may be diluted only if analytes of concern generate responses in excess of the linear range of the instrument.

8.2. FIELD QA/QC CHECKS

In order to evaluate data quality, QA/QC samples will be collected during the sampling activities. [Table 2-1](#) lists the environmental samples and corresponding QC samples to be collected by analysis.

8.2.1. Field Duplicate Samples

Collection of field duplicate samples provides for the evaluation of the laboratory's precision performance by comparing analytical results of two samples from the same location. They are also collected to evaluate field sample collection precision procedures. Samples are collected from one location and sent to the laboratory blind (with two different sample identifications).

Duplicates of solid samples submitted for VOC analysis are obtained from discrete locations without mixing. Duplicates for the remaining analyses require homogenization by filling a decontaminated stainless steel tray or bowl with the sample and mixing it with a decontaminated stainless steel instrument. The mixed sample is divided in half and scooped alternatively from each half to fill the sample container. For surface soil and subsurface soil, one field duplicate will be collected for every 20 samples. For soil vapor, one field duplicate will be collected for every 20 samples. For overburden and bedrock groundwater, one field duplicate will be collected for every 20 samples or one per sampling event (for less than 20 samples).

8.2.2. MS/MSDs

MS/MSD samples are duplicate samples that are collected in the field and have spiking solutions added at the laboratory during sample preparation. MS/MSD samples are considered identical to the original sample. The percent recovery of the spiked amount indicates the accuracy of the extraction as well as interferences caused by the matrix. Relative percent differences (%RPD) between spike sample recoveries or between duplicate samples will indicate the precision of the data. One MS/MSD sample set will be collected for every 20 environmental samples per matrix submitted to the laboratory (minimum frequency of 5%) or one MS/MSD for less than 20 samples per matrix.

8.2.3. Equipment Blanks

Equipment blanks will only be required when sampling equipment is decontaminated and reused for sample collection. Equipment blanks are not required for disposable equipment that is only used for one sample (*i.e.*, disposable sterile plastic scoops). As presented in Section 8.1.3, for surface soil and subsurface soil analysis, one equipment blank will be collected per 20 soil samples. One equipment blank will be collected per 20 samples of overburden and bedrock groundwater.

8.2.4. Field Blanks

As presented in Section 8.1.3, one field blank will be collected per 20 samples or once per day, whichever is more conservative.

8.2.5. Trip Blanks

Trip blanks, presented in Section 10.1.3, will be included in sample coolers at a frequency of either one trip blank per cooler, consistent with Consultant's internal policy, or one trip blank per shipment of samples sent to the laboratory for VOCs.

8.2.6. Temperature Blanks

Temperature blanks will consist of vials of water that have undergone shipment from the sampling site to the laboratory in coolers with the environmental samples to be analyzed for the sampling program. The temperature of these blanks will be measured at the laboratory upon receipt of the sample cooler to verify compliance with the cooler temperature requirement.

8.3. CORRECTIVE ACTION

Generally, the following corrective actions may be taken by the laboratory. When analytical parameters that are within the control of the laboratory, including calibration, instrument performance, and blank criteria, are not met, the cause of the problem will be located and corrected. The analytical system will then be recalibrated. Sample analysis will not begin until calibration, instrument performance, and blank criteria are met. When matrix spike, standard, or duplicate analyses are out of control, samples analysis will cease. The problem will be investigated. Depending on the results of the overall QC program for the sample set, the data may be accepted, accepted with qualification, or determined to be unusable.

If, through the application of the corrective actions listed in this QCP, the data is determined to be unusable, the QC analysis will be re-prepared and reanalyzed. If QC criteria are met upon reanalysis, only the new results are reported. If QC criteria are still not met upon reanalysis, both sets of sample results will be reported and the Consultant QAO will be notified of the situation at the time of sample analysis.

If matrix interferences are suspected, the Consultant QAO will be contacted. Unless sample screening indicates the presence of high concentration target analytes, samples may be diluted in the analysis only if analytes of concern generate responses in excess of the linear range of the instrument.

If the laboratory has taken appropriate actions and matrix interferences prevent the laboratory from achieving the specified detection limits, the Consultant QAO will be contacted as soon as the situation is identified. The Laboratory Project Manager will document, in the data package case narrative, how the laboratory demonstrated good analytical practices in order to attempt to achieve the specified reporting detection limits.

9. DATA DELIVERABLES

Definitive data will be generated in the laboratory. The laboratory-generated data will be entered into the laboratory database management system (DBMS) and presented in data packages. The laboratory will perform the data review process, including a minimum of 10 percent check of the data back to raw data in the secondary review by a laboratory supervisor. Validation of the sample data will be performed as described in this QCP.

Laboratory analytical data will be provided in EDD format, in accordance with the laboratory's internal protocol for NYSDEC deliverable requirements for electronic data as outlined in the NYSDEC Electronic Data Deliverable Manual (NYSDEC, 2013) and subsequent updates. The generated EDD must be reviewed by the laboratory with software specifically developed for this task called Electronic Data Processor (EDP). EDP, a program that compares NYSDEC valid values to EDD values prior to submittal, and the database management software are both distributed by EarthSoft and is called EQUIS™. EDDs populated by the laboratory will include Sample_v3, TestResult_v3, and Batch_v3 (or latest versions). Other tables will be prepared upon NYSDEC request.

Data will be managed by the consultant in a relational DBMS or EQUIS™. Laboratory analytical data will be provided in electronic disk deliverable format for direct upload into the DBMS or EQUIS™.

Records will be incorporated into the final project files. Field logs, data packages, and records will be included in the Consultant project file which will be archived for a period of ten years.

The laboratory is responsible for providing an EDD that matches the hardcopy and electronic data package for sample and analysis information. The EDD records must be the same format (*i.e.*, flat file format). The EDD files will be populated by the laboratory with NYSDEC valid values in effect at the time of file generation. Field samples that are not collected from the project site should not be included in the laboratory report or EDD.

The DBMS will be used to provide custom queries and reports to support data validation, data analysis, and report preparation. Data validation qualifiers will be entered into the DBMS by hand. The DBMS will be checked independently to minimize data transmittal error and loss.

Generally, the information flow will include the following steps:

- Samples will be collected in the field and transported to the laboratory;
- Samples will be analyzed at the laboratory and data generated;
- The laboratory data will be sent to the data validator for evaluation and to the Project Manager for preliminary evaluation;
- Qualified data will be sent to data management personnel and entered into the DBMS;
- The final data set from the DBMS will be provided to the Project Manager for data evaluation in terms of project goals; and
- Project decisions based on results of the data analysis will be reported to the client.

Records will be incorporated into the final project files for the samples. The field logs, data packages, and records will be included in the project files. The project files will be archived by the Consultant for a period of ten years.

10. DATA VALIDATION AND USABILITY

Data validation will be performed on the data from the surface soil, subsurface soil, soil vapor, and overburden and bedrock groundwater sampling activities. The data validator must meet the requirements identified in NYSDEC *DER-10/Technical Guidance for Site Investigation and Remediation* dated May 3, 2010. Current USEPA Region II validation guidance and NYSDEC DUSR guidance (NYSDEC, 2010) will be applied as described in the following section.

Upon request by the data validator, the laboratory will provide additional or supplemental information within three working days of the request.

10.1. VALIDATION PROCEDURES

Data Validation is a process of determining the suitability of a measurement system for providing useful analytical data. Data validation is essentially a three-step process in which the analytical data's QA/QC information is first compared to a series of QA/QC criteria. Based on the results of this comparison, the analytical data are then assigned qualifiers, which provide an indication of the data's usability. Finally, an overall evaluation of the data's usability is performed.

Full validation will be performed on the surface soil, subsurface soil, soil vapor, and overburden and bedrock groundwater data generated for this project for each analytical method.

Data will be evaluated during validation using the QA/QC criteria established in the analytical methods, the quality control requirements and corrective actions listed in [Tables 2-6 to 2-11](#) and laboratory established control limits.

Full data validation consists of a review of data summary forms and raw analytical data that are provided in the data packages. During the full validation, data validators will recalculate selected laboratory sample calculations using raw data when verifying sample results. In addition, data validators will review raw data to verify that compound identification was performed correctly and transcription errors are not present.

Utilizing the DUSR process as guidance, the following questions will be considered during the validation:

1. Is the data package complete as defined under the requirements for the most current DEC ASP Category B or USEPA Contract Laboratory Program (CLP) deliverables?
2. Have the holding times been met?
3. Do all the QC data: blanks, instrument tunings, calibration standards, calibration verifications, surrogate recoveries, spike recoveries, duplicate analyses, laboratory controls and sample data fall within the protocol required limits and specifications?
4. Have the data been generated using established and agreed upon analytical protocols?
5. Does an evaluation of the raw data confirm the results provided in the data summary sheets and quality control verification forms?
6. Have the correct data qualifiers been used and are they consistent with the most current DEC ASP?
7. Have any QC exceedances been specifically noted in the DUSR and have the corresponding QC summary sheets from the data package been attached to the DUSR?

The following parameters will be included in the full data validation for organic and inorganic analyses, where applicable for each analysis method, unless otherwise noted:

- QCP compliance;
- Chain-of-custody records;

- Sample collection and sample preservation;
- Percent solids;
- Holding times;
- GC/MS tuning criteria;
- Instrument performance;
- Calibration;
- Analytical sequence;
- Blank analysis;
- Surrogate recovery;
- MS/MSD analysis;
- Laboratory duplicate analysis;
- Field duplicate analysis;
- LCS analysis;
- ICP interference check sample analysis;
- ICP serial dilution analysis;
- Internal standards performance;
- Target analyte identification, quantitation, and QLS;
- Confirmation analysis; and
- Deliverables and documentation completeness.

Unless requested by the Project Manager, TICs for VOC and SVOC analyses will not be evaluated as part of the validation process.

10.2. ASSIGNMENT OF QUALIFIERS

Data affected by excursions from the QA/QC criteria will be qualified using the following USEPA Region II data validation guidance documents or the most current documents and professional judgment.

- USEPA. 2006c. USEPA Region II Data Validation SOP of PCBs by Gas Chromatography SW-846 Method 8082A, SOP HW-45 Revision 1. New York, NY;
- USEPA. 2008a. Reviewed 2009. USEPA Region II Validating Volatile Organic Compounds by SW-846 Method 8260B, SOP HW-24 Revision 2. New York, NY;
- USEPA. 2008b. Reviewed 2009. USEPA Region II Validating Semivolatile Organic Compounds by SW-846 Method 8270, SOP HW-22 Revision 4. New York, NY;
- USEPA. 2012a. USEPA Region II Evaluation of Metals Data for the CLP Program, SOP HW-2a Revision 15. Albany, New York; and
- USEPA. 2012b. USEPA Region II Mercury and Cyanide Data Validation, SOP HW-2c Revision 15. Albany, New York.

The application of these validation guidelines will be modified to reflect method and QCP requirements. Analytical laboratory qualifiers will be provided at the time of reporting.

10.3. DATA USABILITY EVALUATION

The specific data quality requirements including precision, accuracy, representativeness, comparability, sensitivity, and completeness will be assessed during data validation. Data usability with respect to the DQOs

and data uses will be compared to the project requirements. In the event that the completeness objective of 95 percent is not achieved, samples may be recollected at the discretion of the Consultant Project Manager.

Based on the QA/QC information review and the qualifiers assigned to the analytical data, an overall evaluation of the data's usability will be performed. Data usability is defined as the percentage of data that remains unqualified or is qualified as approximate or non-detected due to blank contamination, divided by the data reported by the laboratory times 100. The percent usability excludes the data qualified as rejected due to major QA/QC excursions. The non-usable data is defined as the percentage of the data qualified as rejected divided by the data reported by the laboratory times 100. The data usability will be provided for each type of analysis performed.

The data usability evaluation considers the data parameters of precision, sensitivity, accuracy, representativeness, comparability, and completeness which are described as follows:

- Precision is evaluated through the review of field duplicate samples, laboratory duplicates, and MS/MSD samples;
- Sensitivity is evaluated through the review of reported detection limits;
- Accuracy is evaluated through the review of MS/MSD samples, internal standards, surrogate recoveries, LCS recoveries, calibration, and instrument performance checks;
- Representativeness is evaluated through the review of holding times, sample preparation, blank analysis, and target compound identification and quantification;
- Comparability is evaluated through the review of the analytical methods and reporting procedures for consistency; and
- Completeness is defined as the overall percentage of sample results that are determined to be usable.

10.4. DATA VALIDATION REPORT

The DUSR will contain separate QA sections in which data quality information collected during the investigation is summarized.

The DUSR will include the following:

- Guidelines used to evaluate the data;
- Summary of samples collected and analyses performed;
- Data qualifiers applied to sample results;
- Narrative that identifies major and minor analysis and QC excursions detected for each parameter evaluated for each analysis;
- Additional issues and information that may be beneficial to the data user are discussed;
- Data summary forms; and
- Data usability.

The DUSR will be prepared under the direction of the QAO.

Table 2-1. Field sampling summary

Parameter (Method)	Matrix	Sample Containers And Volumes	Preservation	Holding Times	Number of Investigative Samples	Field Duplicate	Trip Blank	MS/MSD And Spike Duplicate	Field Blank	Equipment Blank
VOCs Low Level (USEPA Methods 5035A/8000C/8 260C) ¹	Surface Soil, Subsurface Soil	Encore sampler in accordance with USEPA Method 5035A.	≤6°C Sealed and Headspace Free	At the laboratory within 48 hours of collection: Add methanol solution to 5 grams of sample in accordance with USEPA Method 5035A. 14 days from collection to analysis	147	One per 20 samples or one per matrix (for less than 20 samples)	1 each in cooler with VOC samples	One per 20 samples or one per matrix (for less than 20 samples)	One per sampling event for each matrix	One per 20 samples or one per sampling event as required for each matrix
VOCs (USEPA Methods 5035A/8000C/8 260C) ¹	Groundwater	3- 40 milliliter glass vials with Teflon®-lined septum caps	≤6°C HCL to pH2 FC Sealed and Headspace Free	Analysis within 14 days from collection for preserved samples. Analysis within 7 days from collection for samples not acid preserved	81	One per 20 samples or one per matrix (for less than 20 samples)	1 each in cooler with VOC samples	One per 20 samples or one per matrix (for less than 20 samples)	One per sampling event for each matrix	One per 20 samples or one per sampling event as required for each matrix
VOCs (USEPA Method TO15)	Soil Vapor	6.0 Liter SUMMA® vacuum canisters	None	Analysis within 30 days from collection to analysis. Used and un-used canisters must be returned to the laboratory within 15 days of shipment of the canisters to the sampling location.	8	One per 20 samples or one per matrix (for less than 20 samples)	NA	NA	One per 20 samples or one per sampling event as required for each matrix	NA

Table 2-1. Field sampling summary

Parameter (Method)	Matrix	Sample Containers And Volumes	Preservation	Holding Times	Number of Investigative Samples	Field Duplicate	Trip Blank	MS/MSD And Spike Duplicate	Field Blank	Equipment Blank
Vinyl chloride, Styrene (USEPA Methods 5035A/8000C/8260C) ^{2A}	Groundwater	3- 40 milliliter glass vials with Teflon®-lined septum caps	≤6°C Unpreserved	Analysis within 7 days from collection for unpreserved samples.	81	One per 20 samples or one per matrix (for less than 20 samples)	1 each in cooler with VOC samples	One per 20 samples or one per matrix (for less than 20 samples)	One per sampling event for each matrix	One per 20 samples or one per sampling event as required for each matrix
SVOCs (USEPA Methods 3510C/8000C/8270D) ²	Groundwater	2-one liter amber glass container with Teflon® lined screw caps	≤6°C	7 days from collection to extraction; 40 days from extraction to analysis.	72	One per 20 samples or one per matrix (for less than 20 samples)	NA	One per 20 samples or one per matrix (for less than 20 samples)	One per sampling event for each matrix	One per 20 samples or one per sampling event as required for each matrix
SVOCs (USEPA Methods 3541/3550C/8000C/8270D) ²	Surface Soil, Subsurface Soil	250 milliliter wide mouth glass container with Teflon® lined lid. 100 grams sample volume required	≤6°C	14 days from collection to extraction; 40 days from extraction to analysis For SPLP: 14 days from collection to extraction, 7 days from extraction to extraction. 40 days from extraction to analysis	161	One per 20 samples or one per matrix (for less than 20 samples)	NA	One per 20 samples or one per matrix (for less than 20 samples)	One per sampling event for each matrix	One per 20 samples or one per sampling event as required for each matrix

Table 2-1. Field sampling summary

Parameter (Method)	Matrix	Sample Containers And Volumes	Preservation	Holding Times	Number of Investigative Samples	Field Duplicate	Trip Blank	MS/MSD And Spike Duplicate	Field Blank	Equipment Blank
PCBs (USEPA Methods 8000C/8082A) ²	Groundwater	2-one liter amber glass containers with Teflon® lined screw caps	≤6°C	Method holding time: None Project Holding Time: 7 days from collection to extraction; 40 days from extraction to analysis	72	One per 10 samples or one per matrix (for less than 20 samples)	NA	One per 20 samples or one per matrix (for less than 20 samples)	One per sampling event for each matrix	One per 10 samples or one per sampling event as required for each matrix
PCBs (USEPA Methods 8000C/8082A) ²	Surface Soil, Subsurface Soil	250 milliliter wide mouth glass container with Teflon® lined lid. 100 grams sample volume required	≤6°C	Method holding time: None Project Holding Time: 14 days from collection to extraction; 40 days from extraction to analysis	112	One per 20 samples or one per matrix (for less than 20 samples)	NA	One per 20 samples or one per matrix (for less than 20 samples)	One per sampling event for each matrix	One per 10 samples or one per sampling event as required for each matrix
Organochlorine Pesticides (USEPA Methods 3510C/3520C/8081A/8081B) ⁴	Groundwater	1-one liter amber glass container with Teflon® lined screw caps	<6°C	7 days from collection to extraction; 40 days from extraction to analysis	72	One per 20 samples or one per matrix (for less than 20 samples)	NA	One per 20 samples or one per matrix (for less than 20 samples)	One per sampling event for each matrix	One per 20 samples or one per sampling event as required for each matrix
Organochlorine Pesticides (USEPA Methods 3541/3550B/8081A/8081B) ⁴	Surface Soil, Subsurface Soil	250 milliliter wide mouth glass container with Teflon® lined lid. 100 grams sample volume required	<6°C	14 days from collection to extraction; 40 days from extraction to analysis	66	One per 20 samples or one per matrix (for less than 20 samples)	NA	One per 20 samples or one per matrix (for less than 20 samples)	One per sampling event for each matrix	One per 20 samples or one per sampling event as required for each matrix

Table 2-1. Field sampling summary

Parameter (Method)	Matrix	Sample Containers And Volumes	Preservation	Holding Times	Number of Investigative Samples	Field Duplicate	Trip Blank	MS/MSD And Spike Duplicate	Field Blank	Equipment Blank
Total Metals (USEPA Methods 3010A/6010C) ²	Groundwater	1-1000 milliliter polyethylene or fluorocarbon (TFE or PFA) container. 500 milliliters sample volume required.	HNO ₃ to pH<2 ≤6°C	180 days from collection to analysis	72	One per 20 samples or one per matrix (for less than 20 samples)	NA	One per 20 samples or one per matrix (for less than 20 samples)	One per sampling event for each matrix	One per 20 samples or one per sampling event as required for each matrix
Total Metals (USEPA Methods 3050B/6010C) ²	Surface Soil, Subsurface Soil	4 ounce wide mouth polyethylene or fluorocarbon (TFE or PFA) container. 50 grams sample volume required.	≤6°C	180 days from collection to analysis For SPLP: 180 days from collection to extraction, 180 days from extraction to analysis	153	One per 20 samples or one per matrix (for less than 20 samples)	NA	One per 20 samples or one per matrix (for less than 20 samples)	One per sampling event for each matrix	One per 20 samples or one per sampling event as required for each matrix
Mercury (USEPA Method 7470A) ³	Groundwater	1-1000 milliliter polyethylene or fluorocarbon (TFE or PFA) container. 500 milliliters sample volume required.	≤6°C HNO ₃ to pH<2	28 days from collection to analysis	72	One per 20 samples or one per matrix (for less than 20 samples)	NA	One per 20 samples or one per matrix (for less than 20 samples)	One per sampling event for each matrix	One per 20 samples or one per sampling event as required for each matrix

Table 2-1. Field sampling summary

Parameter (Method)	Matrix	Sample Containers And Volumes	Preservation	Holding Times	Number of Investigative Samples	Field Duplicate	Trip Blank	MS/MSD And Spike Duplicate	Field Blank	Equipment Blank
Mercury (USEPA Method 7471B) ²	Surface Soil, Subsurface Soil	4 ounce wide mouth polyethylene or fluorocarbon (TFE or PFA) container. 50 grams sample volume required.	≤6°C	28 days from collection to analysis For SPLP: 28 days from collection to extract generation, 28 days from extraction to analysis	153	One per 20 samples or one per matrix (for less than 20 samples)	NA	One per 20 samples or one per matrix (for less than 20 samples)	One per sampling event for each matrix	One per 20 samples or one per sampling event as required for each matrix
Total Cyanide (USEPA Method 9012B) ⁴	Groundwater	1-1000 milliliter polyethylene or fluorocarbon (TFE or PFA) container. 500 milliliters sample volume required.	<6°C NaOH to pH≥12 OA	14 days from collection to analysis	72	One per 20 samples or one per matrix (for less than 20 samples)	NA	One per 20 samples or one per matrix (for less than 20 samples)	One per sampling event for each matrix	One per 20 samples or one per sampling event as required for each matrix
Total Cyanide (USEPA Method 9012B) ⁴	Surface Soil, Subsurface Soil	4 ounce wide mouth polyethylene or fluorocarbon (TFE or PFA) container. 50 grams sample volume required.	<6°C	14 days from collection to analysis	153	One per 20 samples or one per matrix (for less than 20 samples)	NA	One per 20 samples or one per matrix (for less than 20 samples)	One per sampling event for each matrix	One per 20 samples or one per sampling event as required for each matrix

Table 2-1. Field sampling summary

Parameter (Method)	Matrix	Sample Containers And Volumes	Preservation	Holding Times	Number of Investigative Samples	Field Duplicate	Trip Blank	MS/MSD And Spike Duplicate	Field Blank	Equipment Blank
TCLP (USEPA Method 1311) ⁵	Soil	250 milliliter wide mouth glass container with Teflon [®] lined lid. 100 grams sample volume required	NA	NA	NA	NA	NA	NA	NA	NA
Percent Solids (SM20 2540G) ⁶	Soil	100 milliliter wide mouth glass container with Teflon [®] lined lid. 100 grams sample volume required	4°C	NA	NA	NA	NA	NA	NA	NA

NOTES:

MS/MSD indicates matrix spike/matrix spike duplicate sample for organic analyses. Spike duplicate may be performed for inorganic analyses.

Field blank is not required if disposable equipment is used.

NA indicates Not Applicable.

VOCs indicate volatile organic compounds.

SVOCs indicates semi-volatile organic compounds.

PCBs indicates polychlorinated biphenyls.

TCLP indicates toxicity characteristic leaching procedure.

Number of Investigative Samples depicts the first and second round of groundwater sampling.

Notes:

QLs indicates quantitation limits.

MDLs indicate method detection limits.

µg/Kg indicates microgram per kilogram.

NL indicates not listed.

MDLs and QLS provided by ALS, current as of June 2015.

NA indicates not applicable.

Method Reference:

USEPA. 2007. Statement of Work For Organic Superfund Methods, Multi-Media, Multi-Concentration (SOM02.1). Washington, D.C.

Regulatory Criteria:

1- Unrestricted SCOs indicates Unrestricted Use Soil Cleanup Objectives (SCOs) referenced in the NYSDEC General Remedial Program Requirements, presented in the New York State Codes, Rules and Regulations; Title 6, Chapter IV, Subpart 375 (Part 375), Table 375-6.8(a), December 14, 2006.

2 - Residential Use Soil Cleanup Objectives (SCOs) referenced in the NYSDEC General Remedial Program Requirements, presented in the New York State Codes, Rules and Regulations; Title 6, Chapter IV, Subpart 375 (Part 375), Table 375-6.8(b), December 14, 2006.

3 - Restricted Residential Use Soil Cleanup Objectives (SCOs) referenced in the NYSDEC General Remedial Program Requirements, presented in the New York State Codes, Rules and Regulations; Title 6, Chapter IV, Subpart 375 (Part 375), Table 375-6.8(b), December 14, 2006.

4 - Protection of Groundwater and Ecological Resources SCOs referenced in Table 375-6.8(b) current as of July 2014; or NYSDEC Commissioners Policy/51 (CP-51) Soil Cleanup Guidance Document, issued October 21, 2010, Table 1.

Table 2-2C
Volatile organic compounds using USEPA Method TO-15 Quality Control Requirements and Corrective Actions

Audit	Frequency	Control Limits	Corrective Action
Holding Times	Samples must be analyzed within holding time.	For VOCs analyze within 30 days of sample collection. The laboratory will provide information upon request that supports the holding time of 30 days from collection.	1. If holding times are exceeded for initial or any re-analyses required due to quality control excursions, notify Quality Assurance Officer immediately since re-sampling may be required. 2. Document corrective action in the case narrative.
Canister Cleaning	1. Canisters must be clean and free of any contaminants before sample collection. 2. Canisters may be batch or individually certified. It is recommended that canisters are individually certified for low level, indoor air samples (<0.5 ug/m3).	Preservation of sample containers is not required. 1. Canisters are cleaned using either humid zero air cleaning procedures as described in USEPA Method TO-15 or the canisters are heated in an isothermal oven or by use of heating bands. 2. Batch certified: 10% of the canisters per batch are analyzed by TO-15; 3. Individual certified: each canister is analyzed by TO-15. 4. Clean canisters do not contain analytes above or equal to the PQL. 5. Any canister that has not tested clean will not be used.	Not Applicable
Canister Leak Check	Canisters must be leak tested by pressurizing or evacuating them.	1. The initial pressure or vacuum is measured, the canister valve is closed, and the final pressure or vacuum is checked after 24 hours. If acceptable, the pressure should not vary more than ± 13.8 kPa (± 2 psig) over the 24 hour period.	Not Applicable
MS Tuning	Once every 24 hours prior to initial calibration and calibration verification.	1. Tune key ions and abundance criteria listed in USEPA Method TO-15 must be met for all ions and analyses must be performed within 24 hours of injection of the tune. 2. Part of the tune peak will not be background subtracted to meet tune criteria. 3. Documentation of all tune analyses and evaluations must be included in the data packages.	1. Tune the mass spectrometer. 2. Document corrective action in the case narrative - samples cannot be analyzed until control limit criteria have been met.

Table 2-2C
Volatile organic compounds using USEPA Method TO-15 Quality Control Requirements and Corrective Actions

Audit	Frequency	Control Limits	Corrective Action
Analytical Sequence	Analytical sequence is defined as analyses performed within a 24-hour period.	Not Applicable	Not Applicable
Initial Calibration	Prior to sample analysis and when calibration verification criteria are not met. Initial calibration will contain all target analytes in each standard.	<ol style="list-style-type: none"> 1. At a minimum five concentrations bracketing expected concentration range for all compounds of interest. One standard must be at the practical quantitation limit or lower. 2. The %RSD must be less than or equal to 30 for all target analytes. 3. The RRT for each target analyte at each calibration level must be within 0.06 RRT units of the mean RRT for the compound. 4. The retention time shift for each of the internal standards at each calibration level must be within 20 seconds of the mean retention time over the initial calibration range for each internal standard. 	<ol style="list-style-type: none"> 1. Identify and correct problem. 2. Recalibrate instrument; samples must not be analyzed until initial calibration criteria are met.
Calibration Verification	Every 24 hours, following tune. Calibration verification will contain all target analytes in each standard at a concentration that is representative of the midpoint of the initial calibration.	<ol style="list-style-type: none"> 1. The percent difference must be less than or equal to 30 for all target analytes. 	<ol style="list-style-type: none"> 1. Reanalyze. 2. If criteria are still not met, identify and correct problem, recalibrate; samples cannot be analyzed until continuing calibration criteria are met.

Table 2-2C
Volatile organic compounds using USEPA Method TO-15 Quality Control Requirements and Corrective Actions

Audit	Frequency	Control Limits	Corrective Action
Method Blank Analysis	Prepared with each analytical sequence of 24-hour period. The method blank is an unused, certified canister that has not left the laboratory. The blank canister is pressurized with humidified, ultra-pure zero air and carried through the same analytical procedure as a field sample. The injected aliquot of the blank must contain the same amount of internal standards that are added to each sample.	<ol style="list-style-type: none"> 1. The laboratory method blank must be analyzed after the calibration standard and before any samples are analyzed. 2. The blank can not contain any target analyte at a concentration greater than its practical quantitation limit or analytes with elution characteristics and mass spectral features that would interfere with identification and measurement of a method analyte. 	<ol style="list-style-type: none"> 1. Reanalyze blank. 2. If limits are still exceeded, investigate and correct problem. Otherwise, flag data indicating blank contamination was detected. 3. Document corrective action in the case narrative.
Equipment Blank Analysis	Laboratory-supplied clean SUMMA canister filled with zero air to be included with each batch of canisters.	Less than practical quantitation limit.	<ol style="list-style-type: none"> 1. Investigate problem. 2. Document in the case narrative.
Internal Standards	All samples, blanks and quality control samples. Add sufficient internal standard equivalent to 10 ppbv in the sample.	<ol style="list-style-type: none"> 1. The area response for each internal standard must be within ± 40 percent of the mean area response of the internal standard in the most recent valid calibration. 2. The retention time for each of the internal standards in the blanks must be within ± 0.33 minutes between the analysis and the most recent valid calibration. 3. The retention time for the internal standard in the samples or QC analyses must be within 20 seconds from the calibration verification standard. 	<ol style="list-style-type: none"> 1. Reanalyze. 2. If recovery is still outside criteria, report both analyses. 3. Document corrective action in the case narrative.
Laboratory Control Sample	Every 24 hours, following CCV. Laboratory control sample (LCS) will contain all target analytes in each calibration standard, using a second source, at a concentration that is near a midpoint calibration standard.	<ol style="list-style-type: none"> 1. The percent recovery 70 to 130% for all target analytes. 	<ol style="list-style-type: none"> 1. Reanalyze. 2. If criteria are still not met, discuss corrective actions with O'Brien & Gere QA Manager.

Table 2-2C
Volatile organic compounds using USEPA Method TO-15 Quality Control Requirements and Corrective Actions

Audit	Frequency	Control Limits	Corrective Action
Laboratory Control Sample Duplicate	Every 24 hours, following LCS analysis. Laboratory control sample will contain all target analytes in each calibration standard, using a second source, at a concentration that is near a midpoint calibration standard.	1. The percent recovery 70 to 130% for all target analytes. 2. Within 25 relative percent difference (RPD).	1. Reanalyze. 2. If criteria are still not met, discuss corrective actions with O'Brien & Gere QA Manager.
Field Dup. Analysis	One per sample collection batch.	Within 25 RPD for air samples. For sample results that are less than or equal to five times the practical quantitation limit, the criterion of plus or minus two times the practical quantitation limit will be applied to evaluate field duplicates.	No corrective action required of the laboratory since the laboratory will not know the identity of the field duplicate samples. If these criteria are not met, sample results will be evaluated on a case-by-case basis.
Sample Batching	The laboratory will batch project samples together along with QC samples specified from the project. Non-project information will not be included in the data packages.	Not Applicable	Not Applicable
Sample Analysis	All canister samples should be at temperature equilibrium with the laboratory.	Not Applicable	Not Applicable
Laboratory Control Limits	1. Generated with results for an analyte from a minimum of 20 sample analyses. The average of the sample results and the standard deviation are calculated. The internal warning limits are established at 2 times the standard deviation and the control limits are established at 3 times the standard deviation. The control limits are updated annually.	Not Applicable	Not Applicable

Table 2-2C
Volatile organic compounds using USEPA Method TO-15 Quality Control Requirements and Corrective Actions

Audit	Frequency	Control Limits	Corrective Action
Deliverables	1. CLP-like deliverables must be provided to document each audit item for easy reference and inspection. 2. An example calculation will be provided for each analysis, for each type of matrix in the data package using samples from the project. 3. Any laboratory abbreviations or notations presented in the raw data or summary information will be explained or referenced in the case narrative. 4. Final spiking concentrations will be presented in summary form. 5. Standard tracing information will be provided. 6. Cooler temperatures will be provided in the data packages. 7. Run logs will be provided in the data packages.	Not Applicable	Provide missing or additional deliverables for validation purposes.

Notes:

Data validation will be performed in accordance with QA/QC criteria established in these tables and the analytical methods. Excursions from QA/QC criteria will be qualified based on guidance provided in this QCP.

Communications with the QAO will be documented and included in the data packages.

Table 2-2D
Canister Requirements for VOCs using USEPA Method TO-15

Audit	Frequency	Control Limits	Corrective Action
Sample Canister Preparation For 6 Liter canisters	<ol style="list-style-type: none"> 1. Canisters must be equipped with a laboratory preset regulator, pressure gauge, critical orifice, stainless steel frit dust filter over the orifice, and specially prepared interior surfaces. 2. The flow controller (regulator) is preset at the laboratory for sample collection periods specified by the client and the collection period is clearly identified for each canister. 3. Canisters are shipped to the investigator at subatmospheric pressure approximating negative 30 inches of mercury. 4. The laboratory must record the actual subatmospheric pressure of each canister prior to shipping and upon receipt. 5. Hard seat metal valves are required for the shutoff valves on the canisters. Soft-seated valves are not acceptable. 6. The laboratory must record the current and actual temperature and barometric (atmospheric) pressure of the room at the time the canisters (with the regulators) are prepared for shipment. 7. All 6-Liter canisters must be provided with sample collection regulators. 8. The maximum sampling time will be 24 hours for 6-Liter canisters. 9. It is the laboratory's responsibility to preset the regulators for the sample collection time frames specified and to clearly identify each canister's regulator preset sample collection time. 	Not Applicable	Not Applicable
Sample collection using canisters	<ol style="list-style-type: none"> 1. The maximum flow rate for the collection of soil gas using a canister is 200 milliliters per minute. 2. A 6-Liter canister with a preset flow rate of 200 milliliters per minute and a critical orifice of 0.0060 inches, and not drawing against backpressure constraints, will fill in approximately 30 minutes. 3. The backpressure is primarily a factor of the length of the tubing from the sampling point to the canister, the interior diameter of the tubing, the construction of the sampling probe, and the soil type. 4. If the backpressure constraint is greater than the vacuum in the canister, sample collection will not occur. 5. When possible, the system backpressure should be evaluated prior to sampling. 6. The method by which the ambient pressure and temperature will be obtained must be either weather station or portable instrument for exterior samples. 	Not Applicable	Not Applicable

Table 2-2D
Canister Requirements for VOCs using USEPA Method TO-15

Audit	Frequency	Control Limits	Corrective Action
Canister Cleaning	1. Canisters must be clean and free of any contaminants before sample collection. 2. Canisters will be batch certified. 3. The actual level to which the canisters are certified to must be provided for on the reporting form for clean canister certification. The laboratory must document which canisters are associated with each batch certification. 4. The GC/MS documentation for clean canister certification is to be included in the Data Package.	1. Canisters are cleaned using either humid zero air cleaning procedures as described in NJDEP Method TO-15 or the canisters are heated in an isothermal oven or by use of heating bands. 2. Batch certified: 10% of the canisters per batch are analyzed by NJDEP Method TO-15. 3. The clean canister certification level for the 6-Liter canisters used for soil gas sampling must be down to 0.2 ppbv except for acetone, tetrahydrofuran, 1,4-dioxane, tert-butyl alcohol and xylenes which have higher maximum clean canister certification levels as listed in NJDEP Method TO-15.	1. If the canister used for the batch certification exceeds these levels, the entire batch must be re-cleaned and recertified. 2. Any canister associated with a batch that does not meet certification criteria will not be used.
Canister Leak Check	Canisters must be leak tested by pressurizing or evacuating them.	1. The initial pressure or vacuum is measured, the canister valve is closed, and the final pressure or vacuum is checked after 24 hours. If acceptable, the pressure should not vary more than ± 13.8 kPa (± 2 psig) over the 24 hour period.	Not Applicable

Notes:

Data validation will be performed in accordance with QA/QC criteria established in these tables and the analytical methods. Excursions from QA/QC criteria will be qualified based on guidance provided in this QCP.

Communications with the QAO will be documented and included in the data packages.

USEPA. 2004. Test Methods for Evaluating Solid Waste: Physical/Chemical Methods, SW-846, 3rd Edition, Update IIIB. Washington D.C.

Regulatory Criteria:

- 1- Unrestricted SCOs indicates Unrestricted Use Soil Cleanup Objectives (SCOs) referenced in the NYSDEC General Remedial Program Requirements, presented in the New York State Codes, Rules and Regulations; Title 6, Chapter IV, Subpart 375 (Part 375), Table 375-6.8(a), December 14, 2006.
- 2 - Residential Use Soil Cleanup Objectives (SCOs) referenced in the NYSDEC General Remedial Program Requirements, presented in the New York State Codes, Rules and Regulations; Title 6, Chapter IV, Subpart 375 (Part 375), Table 375-6.8(b), December 14, 2006.
- 3 - Restricted Residential Use Soil Cleanup Objectives (SCOs) referenced in the NYSDEC General Remedial Program Requirements, presented in the New York State Codes, Rules and Regulations; Title 6, Chapter IV, Subpart 375 (Part 375), Table 375-6.8(b), December 14, 2006.
- 4 - Protection of Groundwater and Ecological Resources SCOs referenced in Table 375-6.8(b) current as of July 2014; or NYSDEC Commissioners Policy/51 (CP-51) Soil Cleanup Guidance Document, issued October 21, 2010, Table 1.

Table 2-6A. Laboratory limits and regulatory limits for metals and total cyanide in aqueous samples

Target Analyte	USEPA Method	Method Reference	Laboratory Aqueous QL (µg/L)	Laboratory Aqueous MDL (µg/L)	New York State Class GA Groundwater Standards (µg/L)
Aluminum	6010C	1	100	8	NL
Antimony	6010C	1	60	4.6	3
Arsenic	6010C	1	10	2.1	25
Barium	6010C	1	20	0.75	1,000
Beryllium	6010C	1	3	0.16	3
Cadmium	6010C	1	5	0.17	5
Calcium	6010C	1	1000	40	NL
Chromium	6010C	1	10	0.35	50
Cobalt	6010C	1	50	0.54	NL
Copper	6010C	1	20	2.3	200
Iron	6010C	1	100	9	300
Lead	6010C	1	50	1.3	25
Magnesium	6010C	1	1000	9	35,000
Manganese	6010C	1	10	1.7	300
Mercury	7470A	3	0.2	0.03	0.7
Nickel	6010C	1	40	0.92	100
Potassium	6010C	1	2000	44	NL
Selenium	6010C	1	10	4	10
Silver	6010C	1	10	0.57	50
Sodium	6010C	1	1000	38	20,000
Thallium	6010C	1	10	2.1	0.5
Vanadium	6010C	1	50	3.6	NL
Zinc	6010C	1	20	6.2	2,000
Other Analytes					
Total Cyanide	9012B	2	0.01	0.003	200

Notes:

QLs indicates quantitation limits.

MDLs indicate method detection limits.

µg/L indicates micrograms per liter.

MDLs and QLs provided by ALS, current as of June 2015.

Highlighted cells indicate Lab MDL cannot meet regulatory criteria.

NL indicates not listed.

Table 2-7. VOCs using USEPA Methods 8000C/8260C quality control requirements and corrective actions

Audit	Frequency	Control Limits	Corrective Action
Holding times	Samples must be analyzed within holding time.	<p>For aqueous and solid samples: Analyze within 14 days from collection for preserved samples. Analysis within 7 days from collection to analysis for aqueous samples not acid preserved.</p> <p>For vinyl chloride, styrene - analyze within 7 days from collection.</p> <p>For TCLP - 14 days from collection to extraction. 14 days from extraction to analysis.</p>	<ol style="list-style-type: none"> 1. If holding times are exceeded for initial or any re-analyses required due to QC excursions. 2. Notify QAO since re-sampling may be required. 3. Document corrective action in the case narrative.
MS Tuning	<p>Once every 12 hours prior to initial calibration and calibration verifications.</p> <p>Analytical sequence must be completed within 12 hours of the GC/MS Instrument Performance Check</p>	<ol style="list-style-type: none"> 1. Bromofluorobenzene (BFB) key ions and abundance criteria listed in the method Table 3 must be met for all 9 ions and analyses must be performed within 12 hours of injection of the BFB. 2. Part of the BFB peak will not be background subtracted to meet tune criteria. 3. Documentation of all bromofluorobenzene analyses and evaluation must be included in the data packages. 	<ol style="list-style-type: none"> 1. Tune the mass spectrometer. 2. Document corrective action in the case narrative. 3. Samples cannot be analyzed until control limit criteria have been met.

Table 2-7. VOCs using USEPA Methods 8000C/8260C quality control requirements and corrective actions

Audit	Frequency	Control Limits	Corrective Action
<p>Initial Calibration</p>	<p>Prior to sample analysis and when calibration verifications criteria are not met.</p> <p>Initial calibration will contain all target analytes in each standard.</p> <p>Quantitation of analyses will utilize the initial calibration results.</p>	<ol style="list-style-type: none"> 1. Five concentrations bracketing expected concentration range for all compounds of interest. 2. One second-source standard must be analyzed immediately following the initial calibration at the mid-calibration concentration. This standard must be within 30% recovery or within laboratory control limits. It is also recommended that a separate standard at the MDL level be analyzed after calibration is complete to check sensitivity. 3. Response factor (RF) as listed in Table 4, Method 8260C, with remaining RFs factor ≥ 0.050 except for ketones with allowable response factor ≥ 0.010. 4. For compound with %RSD >20, quantitation must be performed using a separate calibration curve and the Coefficient of Determination (COD) must be ≥ 0.99. If linear regression is used for the calibration curve, the low initial calibration standard should be evaluated for accuracy using criteria of %D $<30\%$ from true value. 5. Relative retention time (RRT) for each target analyte in each calibration standard must agree within ± 0.06 RRT units 	<ol style="list-style-type: none"> 1. Identify and correct problem. 2. If criteria are still not met, recalibrate. 3. Document corrective action in the case narrative. 4. Samples should not be analyzed until calibration control limit criteria are met. 5. Contact QAO to discuss problem target analytes before proceeding with analysis.
<p>Calibration Verification</p>	<p>Every 12 hours, following BFB.</p> <p>The calibration verification will contain all target analytes in each standard at a concentration that is representative of the midpoint of the initial calibration.</p>	<ol style="list-style-type: none"> 1. Within percent drift or percent difference (%D) ≤ 20 for compounds, RF same as listed in initial calibration. 2. The internal standards areas and retention times must meet the method criteria. 	<ol style="list-style-type: none"> 1. Reanalyze. 2. If criteria are still not met, identify and correct problem, recalibrate. 3. Document corrective action in the case narrative; samples should not be analyzed until calibration control limit criteria are met.

Table 2-7. VOCs using USEPA Methods 8000C/8260C quality control requirements and corrective actions

Audit	Frequency	Control Limits	Corrective Action
Preparation Blank Analysis	Every 12 hours, following calibration verification	Methylene chloride less than 3 times QL and 2-butanone and acetone less than 5 times QL remaining analytes less than QL will be provided along with the preparation blank results.	<ol style="list-style-type: none"> 1. Reanalyze blank. 2. If limits are still exceeded, clean instrument, recalibrate analytical system, and reanalyze all samples if detected for same compounds as in blank. 3. Document corrective action in the case narrative - samples cannot be analyzed until blank criteria have been met.
Field Blank Analysis	Collected one per sampling equipment and after every 20 samples.	Methylene chloride less than 3 times QL and 2-butanone and acetone less than 5 times QL remaining analytes less than QL will be provided along with the preparation blank results.	<ol style="list-style-type: none"> 1. Investigate problem. 2. Document in the case narrative.
Trip Blank	1 per cooler containing VOC samples.	Methylene chloride less than 3 times QL and 2-butanone and acetone less than 5 times QL remaining analytes less than QL will be provided along with the preparation blank results.	<ol style="list-style-type: none"> 1. Investigate problem. 2. Document in the case narrative.
Laboratory Control Sample Analysis	<p>Each analytical batch (every 12 hours).</p> <p>Prepared independently from calibration standards.</p> <p>Spike must contain all target analytes and should be at a concentration, which is in the lower 1/2 of the calibration curve.</p>	<p>Recovery within laboratory control limits. For compounds without established laboratory control limits, 70-130% recovery will be used.</p> <p>The lowest acceptable control limits for recovery will be 10%.</p>	<ol style="list-style-type: none"> 1. If recovery failures are above control limits and these compounds are not detected in the associated samples, corrective action is not required. 2. If recovery failures are below control limits, reanalyze LCS and examine results of other QC analyses. 3. If other QC criteria have not been met, stop analysis, locate and correct problem, recalibrate instrument and reanalyze samples since last satisfactory LCS. 4. Document corrective action in the case narrative.

Table 2-7. VOCs using USEPA Methods 8000C/8260C quality control requirements and corrective actions

Audit	Frequency	Control Limits	Corrective Action
Internal Standards	All samples and blanks (including MS/MSD)	<ol style="list-style-type: none"> Response -50% - +200% of internal standards from continuing calibration of the day. RT must be ± 30 sec. from associated calibration verification standard of that sequence. 	<ol style="list-style-type: none"> Reanalyze. If still outside of the limits, report both analyses. Document corrective action in the case narrative.
Surrogate Spike	All samples and blanks (including MS/MSD)	Recovery within laboratory control limits. The lowest acceptable control limits for recovery will be 10%.	<ol style="list-style-type: none"> Reanalyze any environmental or QC sample with surrogates that exceed control limits. If still outside of the limits, report both analyses. Document corrective action in the case narrative.
Matrix Spike/ Matrix Spike Dup. (MS/MSD) Analysis	Collected one per 20 samples or one per matrix (for less than 20 samples) Samples from the investigation must be used for MS/MSD analysis. Spike must contain complete list of target analytes.	Recovery and RPD within laboratory control limits. For compounds without established laboratory control limits, 70-130% recovery will be used. The lowest acceptable control limits for recovery will be 10%.	<ol style="list-style-type: none"> Reanalyze if <10%. If reanalysis is still <10%, report both analyses and document in the case narrative. If >10% and LCS criteria are met, document in case narrative; no additional corrective action required. If LCS criteria are exceeded also, examine other QC data for source of problem; <i>i.e.</i>, surrogate recoveries for extraction efficiency and calibration data for instrument performance issues. Reanalyze samples and associated MS/MSD and LCSs as required. Document corrective action in the case narrative

Table 2-7. VOCs using USEPA Methods 8000C/8260C quality control requirements and corrective actions

Audit	Frequency	Control Limits	Corrective Action
Field Dup. Analysis	<p>Collected one per 20 samples or one per matrix (for less than 20 samples)</p> <p>Field duplicate will not be identified to the laboratory.</p>	<p>Validation criteria: 50% RPD for waters, 100% RPD for solids.</p> <p>For sample results that are less than or equal to five times the QL, the criterion of plus or minus two times the QL will be applied to evaluate field duplicates.</p>	<p>No corrective action required of the laboratory since the laboratory will not know the identity of the field duplicate samples. If these criteria are not met, sample results will be evaluated on a case-by-case basis.</p>
Target Analyte Identification	<p>As required for identification of target analytes</p>	<ol style="list-style-type: none"> 1. The intensities of the characteristic ions of a compound maximize in the same scan or within one scan of each other. Selection of a peak by a data system target compound search routine where the search is based on the presence of a target chromatographic peak containing ions specific for the target compound at a compound-specific retention time will be accepted as meeting this criterion. 2. The relative retention time (RRT) of the sample component is within ± 0.06 RRT units of the RRT of the standard component. 3. The relative intensities of the characteristic ions agree within 30% of the relative intensities of these ions in the reference spectrum. (Example: For an ion with an abundance of 50% in the reference spectrum, the corresponding abundance in a sample spectrum can range between 20% and 80%.) 4. Structural isomers that produce very similar mass spectra should be identified as individual isomers if they have sufficiently different GC retention times 5. Identification is hampered when sample components are not resolved chromatographically and produce mass spectra containing ions contributed by more than one analyte. When gas chromatographic peaks obviously represent more than one sample component (i.e., a broadened peak with shoulder(s) or a valley between two or more maxima), appropriate selection of analyte spectra and background spectra is important. 	<p>Not applicable</p>

Table 2-7. VOCs using USEPA Methods 8000C/8260C quality control requirements and corrective actions

Audit	Frequency	Control Limits	Corrective Action
Target Analyte Identification	As required for identification of target analytes	Examination of extracted ion current profiles of appropriate ions can aid in the selection of spectra, and in qualitative identification of compounds. When analytes co-elute (i.e., only one chromatographic peak is apparent), the identification criteria may be met, but each analyte spectrum will contain extraneous ions contributed by the co-eluting compound.	Not applicable
Target Analyte Quantitation	Apply USEPA Method 8000C for medium level extraction technique	Moisture correction in accordance with USEPA Method 8000C will be applied to the complete set of solid samples, regardless of the percent moisture content..	Not applicable
Tentatively Identified Compound	If required, perform for each sample and blank analysis. Non-target compounds will be reported using a Mass Spectral Library search.	Not applicable	Not applicable
Dilutions	<ol style="list-style-type: none"> 1. When target analyte concentration exceeds upper limit of calibration curve. 2. When matrix interference is demonstrated by the lab and documented in the case narrative (highly viscous samples or a large number of non-target peaks on the chromatogram). 3. It is recommended that a reagent blank be analyzed if an analyte saturates the detector or if highly concentrated analytes are detected. Otherwise data impacted from carryover cannot be used. 4. Laboratory will note in the data deliverables which analytical runs were reported. 	<ol style="list-style-type: none"> 1. The reagent blank will meet the method blank criteria. 	<ol style="list-style-type: none"> 1. Reanalyze reagent blank until method blank criteria are met. 2. Document corrective action in the case narrative.
pH Determination	Once sample aliquot is taken from the VOC vial, the pH of water samples must be determined.	Record pH and report in the case narrative.	Not applicable
Sample Batching	The laboratory will batch project samples together along with QC samples specified from the project. Non-project information will not be included in the data packages.	Not applicable	Not applicable

Table 2-7. VOCs using USEPA Methods 8000C/8260C quality control requirements and corrective actions

Audit	Frequency	Control Limits	Corrective Action
Laboratory control limits	Generated with results for an analyte from a minimum of 20 sample analyses. The average of the sample results and the standard deviation are calculated. The internal warning limits are established at 2 times the standard deviation and the control limits are established at 3 times the standard deviation. The control limits are updated annually.	Not applicable	Not applicable
Deliverables	<ol style="list-style-type: none"> 1. Full CLP-like deliverables must be provided to document each audit item for easy reference and inspection. 2. An example calculation will be provided for each analysis, for each type of matrix in the data package using samples from the project. 3. Any laboratory abbreviations or notations presented in the raw data or summary information will be explained or referenced in the case narrative. 4. Final spiking concentrations will be presented in summary form. 5. Standard tracing information will be provided. 6. Cooler temperatures and any observations of bubbles in sample containers will be provided in the data packages. 7. Run logs will be provided in the data packages. 	Not applicable	Provide missing or additional deliverables for validation purposes.
Method and QCP requirements	The laboratory will perform the method as presented in this QCP and will adhere to the QCP requirements presented herein. Otherwise the laboratory will specifically note any procedures that differ from the method or the QCP in the data package case narrative.	Not applicable	Not applicable

Notes:

Data validation will be performed in accordance with QA/QC criteria established in these tables and the analytical methods. Excursions from QA/QC criteria will be qualified based on guidance provided in this QCP.

Communications with O'Brien & Gere will be documented and included in the data packages.

Source: O'Brien & Gere

Table 2-8. SVOCs using USEPA Methods 8000C/8270D quality control requirements and corrective actions

Audit	Frequency	Control Limits	Corrective Action
Holding Times	Samples must be extracted and analyzed within holding time.	Extract within 7 days from collection for aqueous samples; 14 days for soil samples. Analyze extracts within 40 days of extraction. For TCLP: 14 days from collection to extraction, 7 days from extraction to extraction. 40 days from extraction to analysis	If holding times are exceeded for initial or any re-analyses required due to QC excursions, notify the QAO since re-sampling may be required.
GC/MS Instrument Performance Check	Once every 12 hours prior to initial calibration and calibration verification. Must contain 50ng/uL of 4,4-DDT, pentachlorophenol, and benzidine. Analytical sequence must be completed within 12 hours of the GC/MS Instrument Performance Check	1. Decafluorotriphenylphosphine (DFTPP) key ions and abundance criteria listed in the method must be met for all 13 ions and analyses must be performed within 12 hours of injection of the DFTPP. 2. Part of the DFTPP peak will not be background subtracted to meet tune criteria. 3. Documentation of all DFTPP analyses and evaluations must be included in the data packages. 4. Degradation of 4,4-DDT <20%. Peak tailing must not be evident.	1. Tune the mass spectrometer. 2. Document corrective action in the case narrative - samples cannot be analyzed until control limit criteria have been met.

Table 2-8. SVOCs using USEPA Methods 8000C/8270D quality control requirements and corrective actions

Audit	Frequency	Control Limits	Corrective Action
Initial Calibration	<p>Prior to sample analysis and when calibration verification criteria are not met.</p> <p>Initial calibration will contain all target analytes in each standard.</p> <p>Quantitation of analyses will utilize the initial calibration results.</p>	<ol style="list-style-type: none"> Five concentrations bracketing expected concentration range for all compounds of interest with one standard at or less than the QL One second-source standard should be analyzed immediately following the initial calibration at the mid-calibration concentration. This standard must be within 30% recovery or within laboratory control limits. It is also recommended that a separate standard at the MDL level be analyzed after calibration is complete to check sensitivity. RFs must meet criteria listed in Method 8270D; remaining RFs must be 0.05 with RF of 0.01 for n-nitroso-di-n-propylamine and 2,4-dimethylphenol. For compounds with %RSD >20, quantification must be performed using a separate calibration curve and the COD must be ≥ 0.990. If linear regression is used for the calibration curve, the low level initial calibration standard should be evaluated for accuracy using criteria of %D < 30% from the true value. Relative retention for each target analyte in each calibration standard must agree within + 0.06 units. 	<ol style="list-style-type: none"> Identify and correct problem. If criteria are still not met, recalibrate. Document corrective action in the case narrative - samples should not be analyzed until calibration control limit criteria are met.
Calibration Verification	<p>Every 12 hours, following DFTPP.</p> <p>Calibration verification will contain all target analytes in each standard at a concentration that is representative of the midpoint of the initial calibration.</p>	<ol style="list-style-type: none"> Within method specified criteria, percent drift or percent difference (%D) ≤ 20 for all compounds. Response factor requirements as listed in initial calibration. The internal standards areas and retention times must meet the method criteria. 	<ol style="list-style-type: none"> Reanalyze. If criteria are still not met, identify and correct problem, recalibrate. Document corrective action in the case narrative - samples should not be analyzed until calibration control limit criteria are met.
Preparation Blank Analysis	<p>Prepared with each extraction batch of no more than 20 analytical samples.</p>	<ol style="list-style-type: none"> Common laboratory contaminants (phthalate) less than 5 x QL. Remaining analytes less than QL. 	<ol style="list-style-type: none"> Reanalyze blank. If limits are still exceeded, clean

Table 2-8. SVOCs using USEPA Methods 8000C/8270D quality control requirements and corrective actions

Audit	Frequency	Control Limits	Corrective Action
		2. QLs and MDLs will be provided along with the preparation blank results.	instrument, recalibrate analytical system and re-extract and reanalyze all samples if detected for same compounds as in the blank. 3. Document corrective action in the case narrative - samples should not be analyzed until blank criteria have been met.
Field Blank Analysis	Collected one per 20 samples or one per sampling event.	1. Common laboratory contaminants (phthalate) less than 5 x QL. Remaining analytes less than QL. 2. QLs and MDLS will be provided along with the blank results.	1. Investigate problem. 2. Document in the case narrative.
Laboratory Control Sample (LCS) or Matrix Spike Blank (MSB) Analysis	Prepared with each extraction batch, of no more than 20 analytical samples. Prepared independently from calibration standards. LCS or MSB must contain all target compounds and should be at a concentration that is approximately in the lower 1/2 of the calibration curve.	Recovery within laboratory control limits. For compounds without established laboratory control limits, 70 to 130% recovery will be used. The lowest acceptable control limits for recovery will be 10%.	1. If recovery failures are above control limits and these compounds are not detected in the associated samples, no corrective action is required. 2. If recovery failures are below the control limits, reanalyze LCS and examine results of other QC analyses. 3. If other QC criteria have not been met, stop analysis, locate and correct problem, recalibrate instrument and reanalyze samples since last satisfactory LCS. 4. Document corrective action in the case narrative.
Internal Standards	All samples and blanks (including MS/MSD).	1. Response -50% - +200% of the internal standards from the continuing cal of the day. 2. RT must be ± 30 sec. from calibration verification of that sequence.	1. Reanalyze. 2. If recovery is still outside criteria, report both analyses. 3. Document corrective action in the case narrative.

Table 2-8. SVOCs using USEPA Methods 8000C/8270D quality control requirements and corrective actions

Audit	Frequency	Control Limits	Corrective Action
Surrogate Spike	All samples and blanks (including MS/MSD).	Recovery within laboratory control limits. The lowest acceptable control limits for recovery will be 10%.	<ol style="list-style-type: none"> 1. Reanalyze if more than 1 AE or 1 BN fails, or if any one surrogate recovery is < 10%. 2. If recovery meets criteria, report both analyses. 3. If re-analysis recovery fails and if the recovery is <10%, re-extract sample if within holding time and re-analyze. 4. If re-analysis recovery fails and if the recovery is >10%, report both analyses. 5. Document corrective action in the case narrative.
Matrix Spike/ Matrix Spike Dup. (MS/MSD) Analysis	Collected one per 20 samples or one per matrix (for less than 20 samples) Samples from the investigation must be used for MS/MSD analysis. Spike must contain complete list of target analytes.	Recovery and RPD within laboratory control limits. For compounds without established laboratory control limits, 70-130% recovery will be used. The lowest acceptable control limits for recovery will be 10%.	<ol style="list-style-type: none"> 1. Reanalyze if <10%. 2. If reanalysis is < 10%, report both analyses and document in the case narrative. 3. If reanalysis is >10%, and LCS criteria are met, document in the case narrative. 4. If LCS criteria are exceeded also, examine other QC data for source of problem; i.e. surrogate recoveries for extraction efficiency and calibration data for instrument performance issues; re-extract or reanalyze samples and associated MS/MSD and LCSs as required.

Table 2-8. SVOCs using USEPA Methods 8000C/8270D quality control requirements and corrective actions

Audit	Frequency	Control Limits	Corrective Action
Field Duplicate Analysis	Collected one per 20 samples or one per matrix (for less than 20 samples) Field duplicate will not be identified to the laboratory.	Validation criteria: 50% RPD for waters, 100% RPD for solids. For sample results that are less than or equal to five times the QL, the criterion of plus or minus two times the QL will be applied to evaluate field duplicates.	No corrective action required of the laboratory since the laboratory will not know the identity of the field duplicate samples. sample results will be evaluated on a case-by-case basis.
Percent solids	For soil/ samples, the percent solids will be determined and sample results will be corrected for percent solids.	Not applicable	Not applicable
Target Analyte Identification	As required for identification of target analytes	<ol style="list-style-type: none"> 1. The intensities of the characteristic ions of a compound maximize in the same scan or within one scan of each other. Selection of a peak by a data system target compound search routine where the search is based on the presence of a target chromatographic peak containing ions specific for the target compound at a compound-specific retention time will be accepted as meeting this criterion. 2. The relative retention time (RRT) of the sample component is within ± 0.06 RRT units of the RRT of the standard component. 3. The relative intensities of the characteristic ions agree within 30% of the relative intensities of these ions in the reference spectrum. (Example: For an ion with an abundance of 50% in the reference spectrum, the corresponding abundance in a sample spectrum can range between 20% and 80%.) 4. Structural isomers that produce very similar mass spectra should be identified as individual isomers if they have sufficiently different GC retention times. 5. Identification is hampered when sample components are not resolved chromatographically and produce mass spectra containing ions contributed by more than one analyte. When gas chromatographic peaks obviously represent more than one sample component (i.e., a broadened peak with shoulder(s) or a valley between two or more maxima), appropriate selection of analyte spectra and background spectra is important. 	Not applicable

Table 2-8. SVOCs using USEPA Methods 8000C/8270D quality control requirements and corrective actions

Audit	Frequency	Control Limits	Corrective Action
		6. Examination of extracted ion current profiles of appropriate ions can aid in the selection of spectra, and in qualitative identification of compounds. When analytes coelute (i.e., only one chromatographic peak is apparent), the identification criteria may be met, but each analyte spectrum will contain extraneous ions contributed by the co-eluting compound.	
Cleanup	Gel permeation chromatography should be performed for water extracts with high molecular weight contaminants.	Calibrate according to method. Criteria must be met as listed in method for calibration and blank analysis.	Clean GPC column or replace.
Tentatively Identified Compound (where applicable)	Report 30 SVOCs for each sample and blank analysis. Non-target compounds will be reported using a Mass Spectral Library search.	Not applicable	Not applicable
Sample Batching	The laboratory will batch project samples together along with QC samples specified from the project. Non-project information will not be included in the data packages.	Not applicable	Not applicable
Dilutions	<ol style="list-style-type: none"> 1. When target analyte concentration exceed upper limit of calibration curve. 2. When matrix interference demonstrated by lab and documented in the case narrative (highly viscous samples or a large number of non-target peaks on the chromatogram). 3. Samples should be cleaned up during sample preparation/extraction procedure using appropriate methods when matrix interference is present. 4. Laboratory will note in the data deliverables which analytical runs were reported. 	Not applicable	Not applicable

Table 2-8. SVOCs using USEPA Methods 8000C/8270D quality control requirements and corrective actions

Audit	Frequency	Control Limits	Corrective Action
Laboratory control limits	1. Generated with results for an analyte from a minimum of 20 sample analyses. The average of the sample results and the standard deviation are calculated. The internal warning limits are established at 2 times the standard deviation and the control limits are established at 3 times the standard deviation. The control limits are updated annually.	Not applicable	Not applicable
Deliverables	1. Full CLP-like deliverables must be provided to document each audit item for easy reference and inspection. 2. An example calculation will be provided for each analysis, for each type of matrix in the data package using samples from the project. 3. Any laboratory abbreviations or notations presented in the raw data or summary information will be explained or referenced in the case narrative. 4. Final spiking concentrations will be presented in summary form. 5. Standard tracing information will be provided. 6. Cooler temperatures will be provided in the data packages. 7. Run logs will be provided in the data packages.	Not applicable	Provide missing or additional deliverables for validation purposes.
Method and QCP requirements	The laboratory will perform the method as presented in this QCP and will adhere to the QCP requirements presented herein. Otherwise the laboratory will specifically note any procedures that differ from the method or the QCP in the data package case narrative.	Not applicable	Not applicable

Notes: Data validation will be performed in accordance with QA/QC criteria established in these tables and the analytical methods. Excursions from QA/QC criteria will be qualified based on guidance provided in this QCP. Communications with O'Brien & Gere will be documented and included in the data package

Reanalyze. 2. If still outside of the limits, report both analyses. 3. Document any observations and corrective action in the case narrative.
Identification	<p>Samples, blanks, and QC data.</p>	<p>Retention times must be within established retention time windows or must meet relative retention time criteria.</p> <p>Duel column confirmation (quantitative and qualitative) analysis is required.</p>	<ol style="list-style-type: none"> 1. Investigate problem; reanalyze calibration standards to check for retention time shift. 2. Document any observations and corrective action in the case narrative.

Table 2-10. Organochlorine Pesticides using USEPA Methods 8000C/8081B quality control requirements and corrective actions

Audit	Frequency (Applies to both primary and confirmation columns)	Control Limits (Applies to both primary and confirmation columns)	Corrective Action (Applies to both primary and confirmation columns)
		<p>Retention time windows must be provided for each calibration verification.</p> <p>USEPA CLP Form 10 Summary form, providing the percent difference and retention times for all detected analytes in samples and QC samples, will be provided.</p> <p>Percent difference must be less than 25 %D. %D calculation: Difference between Higher concentration of sample and Lower concentration of sample divided by the Lower concentration of sample times 100.</p>	
Quantitation	Samples, blanks, and QC data.	<p>Confirmation analysis is required.</p> <p>Internal or external standard method may be used. Verify concentration is within linear calibration range of standards.</p> <p>Every effort must be made to meet specified QL requirements.</p> <p>Lab must state the technique used for quantitation of results for the samples.</p>	<ol style="list-style-type: none"> 1. If concentration is above linear calibration range, dilute sample and reanalyze. Dilution should result in concentration in the upper calibration range of the instrument. 2. Document any observations and corrective action in the case narrative.
Field Blank Analysis	Field collected - One per sampling equipment and after every 20 samples.	Compounds concentrations must be <QL.	<ol style="list-style-type: none"> 1. Investigate problem; reanalyze to verify laboratory cross contamination is not a factor. 2. Document any observations and in the case narrative.
Field Duplicate Analysis	Field collected – One for each matrix type, every 20 samples of similar matrix.	<p>Validation criteria: 50% RPD for waters and 100% RPD for solids. For sample results that are less than or equal to five times the QL, the criterion of plus or minus two times the QL will be applied to evaluate field duplicates.</p>	No corrective action required of the laboratory since the laboratory will not know the identity of the field duplicate samples. If these criteria are not met, sample results will be evaluated on a case-by-case basis during the validation process.
Chromatography Presentation	For each standard, sample and QC sample analysis.	Copies of chromatograms provided in the data package must be large enough to view during validation; detail of each peak involved in the Aroclor identification, including peak shape and associated baseline. In the case that matrix interference is detected or manual integration is performed, enlarged copies of those manipulations will be included in the data package for review.	<ol style="list-style-type: none"> 1. Provide requested information.

Table 2-10. Organochlorine Pesticides using USEPA Methods 8000C/8081B quality control requirements and corrective actions

Audit	Frequency (Applies to both primary and confirmation columns)	Control Limits (Applies to both primary and confirmation columns)	Corrective Action (Applies to both primary and confirmation columns)
Cleanup	GPC must be performed for all pesticide solids or water extracts with high molecular weight contaminants. Sulfur must be performed for all sample extracts contaminated with sulfur. Florisil cartridge cleanups are mandatory for all pesticide extracts.	Calibrate according to method. Criteria must be met as listed in method.	For GPC, perform column maintenance, recalibrate. For florisil, obtain a new lot of cartridges.
Sample Batching	The laboratory will batch project samples together along with QC samples specified from the project. Non-project information will not be included in the data packages. USEPA Form 8 Summary form, providing the date, time of analysis of samples and QC samples, surrogate retention times and surrogate retention time window, will be provided.	Not applicable	Not applicable
Confirmation Analysis	Dual column quantitation and qualitative confirmation will be performed. The information presented in CLP Form 10 will be provided in the data package for evaluation.	Not Applicable	Not Applicable
Laboratory control limits	Generated with results for an analyte from a minimum of 20 sample analyses. The average of the sample results and the standard deviation are calculated. The internal warning limits are established at 2 times the standard deviation and the control limits are established at 3 times the standard deviation. The control limits are updated annually.	Not applicable	Not applicable
Percent solids	For solids samples, the percent solids will be determined and sample results will be corrected for percent solids.	Not applicable	Not applicable
Dilutions	<ol style="list-style-type: none"> When target analyte concentration exceed upper limit of calibration curve. When matrix interference demonstrated by lab and documented in the case narrative (highly viscous samples or a large number of non-target peaks on the chromatogram). Samples should be cleaned up during sample preparation/extraction procedure using appropriate methods when matrix interference is present. Laboratory will note in the data deliverables which analytical runs were reported. 	<ol style="list-style-type: none"> The reagent blank will meet the method blank criteria. 	<ol style="list-style-type: none"> Reanalyze reagent blank until method blank criteria are met.
Deliverables	<ol style="list-style-type: none"> Full deliverables must be provided to document each audit item for easy reference and inspection. An example calculation will be provided for each analysis, for each type of matrix in the data package using samples from the project. 	Not applicable	Provide missing or additional deliverables for validation purposes.

Table 2-11. Metals using USEPA Method 6010C, mercury using USEPA Methods 7470A/7471B and total cyanide using USEPA Method 9012B quality control requirements and corrective actions

Audit	Frequency	Control Limits	Corrective Action
Holding Times	Samples must be digested and analyzed within holding time.	Metals: 180 days from collection to analysis. TCLP: 180 days from collection to extraction, 180 days from extraction to analysis. Mercury: 28 days from collection to analysis. TCLP: 28 days from collection to extract generation, 28 days from extraction to analysis Total Cyanide: 14 days from collection to analysis.	If holding times are exceeded for initial or any re-analyses required due to QC excursions. Notify QAO since re-sampling may be required. Document corrective action in the case narrative.
Initial Calibration Verification and Continuous Calibration Verification (ICV, CCV)	Two point calibration for ICP consisting of one standard and one blank. Five point calibration for remaining methods, with one standard at the QL level. Calibrate each time instrument is set up. After calibration, Initial calibration verification (ICV) is performed. The ICV is from a source independent of the calibration standards. A continuing calibration verification (CCV) is analyzed at the beginning of the run, at 10% or every 2 hours. Also verify at the end of each run.	ICV, CCV - 90% to 110% of expected value for ICP, cold vapor AA and colorimeter ICV for Mercury – 90% to 110% of expected true value. CCV for Mercury - 80% to 120% of expected true value. Correlation coefficient for first or second order curve must be ≥ 0.998 for ICP and ≥ 0.995 for mercury.	Reanalyze. If criteria are still not met, identify and correct problem, recalibrate. Document corrective action in the case narrative - samples should not be analyzed until calibration control limit criteria have been met.

1. INTRODUCTION

This Health and Safety Plan (HASP) has been developed to provide both general procedures and specific requirements to be followed by O'Brien & Gere Engineers, Inc. (OBG) personnel while performing Remedial Investigation (RI) activities at a portion of the former Vacuum Oil Refinery consisting of eight City-owned parcels 1, 13, 31, 69, and 75 Cottage Street; 100 Riverview Place; 102 Violetta Street; and 1320 S. Plymouth Avenue (Site) located in Rochester, New York.

This HASP describes the responsibilities, training requirements, protective equipment, and standard operating procedures to be used by OBG personnel to address potential health and safety hazards while in investigation areas. This plan specifies procedures and equipment to be used OBG personnel during work activities and emergency response to minimize exposures of OBG personnel to hazardous materials.

The health and safety considerations of subcontractors to OBG will be set forth in HASPs provided by each subcontractor. Documentation of the subcontractor's HASP will be obtained prior to the start of the subcontractor's work.

1.1 SITE LOCATION AND DESCRIPTION

The Site is located at 1, 13, 31, 69, and 75 Cottage Street; 100 Riverview Place; 102 Violetta Street; and 1320 S. Plymouth Avenue in Rochester, Monroe County, New York and encompasses approximately 15.4 acres. A Site Location map is presented as [Figure 1](#).

The subject property is bordered by the Genesee River to the east/southeast/south beyond a narrow strip of New York State-owned land, residential property to the west, vacant land (formerly a junkyard addressed as 15 Flint Street) to the northwest, and Flint Street with commercial land to the north across Flint Street. Vacant land addressed as 5 Flint Street and containing a single, three-story building is also located near the north end of the Site. Although 5 Flint Street is located on the northern side of the Site, the Site also wraps around 5 Flint Street in a "U" shape.

The Site was historically operated as a part of a refinery, blending, and bulk oil storage facility from approximately 1866 to 1930. Crude oil, kerosene, naphtha, finished lubricants, and containers for these products (*e.g.*, wooden barrels, tin cans, and drums) were manufactured and stored on-Site. Operations and facilities that formerly occupied the Site include former canal beds, rail yard including tank car use and cleaning, barrel manufacturing plant, numerous storage areas, and underground facilities that previously serviced Site operations (*e.g.*, utilities, sewers, and piping).

While most of the abovegrade structures have been demolished and removed, some remnants of former structures remain. It is unknown as to what subsurface structures remain. Based on historic aerial photographs, the structures were removed sometime between 1926 and 1958. An asphalt-paved bicycle/walking path runs through the entire eastern side of the Site from the north end of the property to the south of the property and beyond in both directions. An approximate 1.2 acre grass-covered area is located on the eastern boundary of the subject property along the Genesee River. The rest of the Site is undeveloped (with the exception of the historic items mentioned above) and consists of wooded and vegetative areas.

Subsurface environmental investigations were conducted at the Site by ExxonMobil in 2008 to evaluate soil and groundwater conditions. These investigations were conducted on approximately 27 acres of the Vacuum Oil Site and included properties owned by both the City (approximately 15 acres) and private individuals. The investigations identified the presence of volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), metals, and polychlorinated biphenyls (PCBs) in both soil and groundwater.

The Site was subsequently entered into the Brownfield Cleanup Program on April 6, 2015 as Site No. C828190.

1.2 IMPLEMENTATION OF HEALTH AND SAFETY PLAN

The requirements and guidelines presented in this HASP are based on a review of available information and an evaluation of potential hazards. This HASP incorporates by reference the applicable Occupational Safety and Health Administration (OSHA) requirements in 29 CFR Part 1910 and 29 CFR Part 1926. The protective

equipment selection was made according to Subpart I of 29 CFR 1910. OBG personnel are required to read this HASP before beginning work. This HASP will be available for inspection and review by OBG employees while work activities are underway.

When conducting the RI activities listed in the Work Plan, OBG personnel will comply with this HASP. On Site OBG personnel will notify the OBG Site Safety and Health Coordinator (SSHC) of matters of health and safety. The SSHC is responsible to the Project Manager for monitoring activities, monitoring compliance with the provisions of this HASP, and for modifying this HASP to the extent necessary if conditions change.

This HASP is specifically intended for guiding the conduct of OBG activities defined in the RI Work Plan in the areas of the Site specified for these work activities. Although this HASP can be made available to interested persons for informational purposes, OBG does not assume responsibility for the interpretations or activities of any persons or entities other than employees of OBG.

The health and safety considerations of subcontractors to OBG will be set forth in HASPs provided by each subcontractor to OBG. Documentation of the subcontractor's HASP will be obtained prior to the start of the subcontractor's work. OBG will review each subcontractor's HASP and evaluate for adequacy; however, OBG will not be responsible for subcontractor health and safety while on-Site.

1.3 PROJECT ORGANIZATION

Personnel involved in the RI activities at the Site implicitly have a part in implementing the HASP. Among them, the Project Officer, the Project Manager, the Corporate Health and Safety Manager, the SSHC, and the Site Supervisor have specifically designated responsibilities. Their names and telephone numbers are listed in [Table 1-1](#) (below). Other key OBG project personnel, the project's organization, and other primary contacts for the project are presented in the RI Work Plan.

Key project personnel and their responsibilities with regard to the sampling activities are discussed below.

Project Officer

Douglas M. Crawford, P.E. is the Project Officer. The Project Officer is responsible for the overall administration and technical execution of the project. The Project Officer is responsible for providing upper level management support for health and safety. The Project Officer will provide sufficient authority and resources to the Construction Supervisor and SSHC to fully implement health and safety requirements as outlined in this HASP, contract documents, and regulatory requirements. The Project Officer will provide this support to the entire project while the Construction Project Officer will provide additional attention and support to site remediation activities.

Project Manager

Deborah Wright, CPG, is the Project Manager. The Project Manager reports to the Project Officer and is directly responsible for the technical progress and financial control of the project. The Project Manager will have overall responsibility for implementing HASP requirements for the duration of the project. The Project Manager will be the primary liaison to and from the City for health and safety.

Corporate Health and Safety Manager

Mr. Jeffrey R. Parsons, C.I.H. is the Corporate Health and Safety Manager. The OBG Corporate Health and Safety Manager will make safety-related recommendations regarding the work area to the SSHC and engage ongoing support from OBG Corporate Safety Department as necessary. Inspections will periodically be conducted to monitor worker health and safety and will address issues such as subcontractor pre-qualification, site safety orientation programs and documentation, implementation of permit programs (confined space, hot work, etc.) safety planning, accident investigations, meetings with client, adequacy of personal protective equipment (PPE), air monitoring needs, and general construction safety issues. The OBG Corporate Health and Safety Manager will approve procedural changes and modifications to this HASP and will prepare a Monthly Safety Report to be provided to Project Manager and the City.

OBG Corporate Health and Safety Specialist

Mr. Steven M. Thompson, CHST will act as the OBG Corporate Health & Safety Specialist (HSS) on this project and will assist the OBG Manager of Corporate Health and Safety in the implementation of the Corporate Health and Safety program. General support tasks related to the implementation of the OBG Corporate Health and Safety Program include safety audits, air monitoring, training, accident investigations, etc.

Site Safety and Health Coordinator

The OBG Site Safety and Health Coordinator (SSHC) for this investigation will be Anthony DiNardo. The SSHC for OBG reports to the OBG Project Manager, coordinates his activities with the OBG Corporate Associate for Safety and Health, and establishes operating standards and coordinates overall project safety and health activities associated with implementation of the RI field activities. The SSHC reviews project plans and revisions to plans to determine that safety and health procedures are maintained throughout the investigation. The SSHC audits the effectiveness of the HASP on a continuing basis and suggests changes, if necessary, to the Project Manager.

Specifically, the SSHC is responsible for the conducting the following actions:

- Provide a complete copy of the HASP before the start of activities;
- Familiarize workers with the HASP;
- Conduct health and safety training and briefing sessions;
- Document the availability, use, and maintenance of personal protective and other safety or health equipment;
- Maintain safety awareness among OBG employees and communicating safety and health matters to them;
- Review field activities for performance in a manner consistent with OBG policy and this HASP;
- Monitor health and safety conditions during field activities;
- Coordinate with emergency response personnel and medical support facilities;
- Notify the Project Manager of the need to initiate corrective actions in the event of an emergency, an accident, or identification of a potentially unsafe condition;
- Notify the Project Manager of an emergency, an accident, the presence of a potentially unsafe condition, a health or safety problem encountered, or an exception to this HASP;
- Recommend improvements in safety and health measures to the Project Manager; and,
- Conduct safety and health performance and system audits.

The SSHC has the authority to recommend that the Project Manager take the following actions:

- Suspend field activities or otherwise limit exposures if the health or safety of any OBG employee appears to be endangered;
- Notify OBG personnel to alter work practices that the SSHC deems to not protect them; and,
- Suspend an OBG employee from field activities for violating the requirements of this HASP.

Site Supervisor

The Site Supervisor, designated by and reporting to the OBG Project Manager, will be Anthony DiNardo and is responsible for coordinating project requirements in the field. The Site Supervisor oversees daily activities and is, therefore, responsible for implementing health and safety requirements on a daily basis in the field. The Site Supervisor is also responsible for conducting daily safety inspections and coordinating timely correction of observed deficiencies with any sub-contractor. The Site Supervisor shall be qualified to also serve as the OBG Site SSHC with respect to OBG's scope of work.

Asbestos-Containing Material (ACM) Inspector

The ACM Inspector will be Logan Reid. If suspect ACM is encountered during any of the excavation activities, work will cease and the ACM inspector will be contacted. The ACM inspector will collect a sample of the suspect ACM for laboratory analysis to confirm ACM is present. If positive, the ACM material will need to be remediated,

managed, and disposed of in accordance with Industrial Code Rule 56, prior to completion of the investigation activities at that location.

2. HAZARD ANALYSIS

General chemical and environmental hazards that may be encountered while implementing the RI field activities are summarized in Section 2.1. Specific health and safety considerations for field tasks detailed in the RI Work Plan are presented in the Job Safety Analyses (JSAs) provided in [Appendix A](#) of this HASP.

Both the potential health and safety hazards and the hazard and contaminant control procedures for each task of the RI are discussed in the sections below.

2.1 GENERAL RI FIELD ACTIVITY HAZARDS

2.1.1 Chemical Hazards

Chemical hazards that may be encountered during the RI field implementation are related to inhalation, ingestion, and skin exposure to constituents of concern (COC's). COC's may include PCBs, VOCs, SVOCs, Pesticides, and Metals. ACM may also be encountered during field work activities including soil boring advancement and test pit excavation. Note, if suspect ACM is confirmed, work shall be halted in the vicinity and appropriate measures will be discussed with the City DEQ Project Manager and NYSDEC Project Manager. A scope of work addendum will be prepared and implemented in accordance with New York State Department of Labor (NYS DOL) Industrial Code Rule 56 regulations to address the ACM.

The potential for unprotected personnel for inhalation of constituents during intrusive RI field activities is low to moderate. The potential for unprotected personnel for dermal contact with soils or water containing COCs during drilling and sampling operations is moderate to high. Proper use of personnel protective equipment is intended to reduce potential exposure to contaminants.

2.1.2 Potential Environmental and Physical Hazards

Prior to initiating activity, the work conditions will be discussed with all employees. Hazards will be identified and protective measures will be explained.

Environmental hazards, in addition to contaminants, include fauna and flora. Aggressive fauna, such as ticks, fleas, mosquitoes, bees, wasps, spiders, and snakes may be present. Poison ivy and poison oak are abundant at the Site.

Physical Hazards involved with RI field activities are primarily associated with the work environment. The work area presents hazards of slips, trips, and falls from equipment and irregular walking surfaces. Weather related hazard include wet, muddy, slick, walking surfaces and unstable soil, sunburn, lightning, rain, snow, ice, and heat and cold related illnesses. There exists a potential for incidents involving personnel struck by or struck against objects resulting in fractures, cuts, punctures, or abrasions. Walking and working surfaces during activities may involve slip, trip, and fall hazards. Dense tree cover, brush, old utilities and subsurface structures, ponded water, and fallen trees also present potential physical hazards at the Site.

Materials handling and manual site preparation work associated with the RI field activities may cause blisters, sore muscles, and joint and skeletal injuries; and may present eye, contusion and laceration hazards. A common type of accident that occurs in material handling operations is the "caught between" situation when a load is being handled and a finger or toe gets caught between two objects. Extreme care must be taken when loading and unloading material. Proper lifting technique must be employed. Clearing around the Site to access sampling points will be conducted by the subcontractor. Chainsaws, weed trimmers, saws, and cutters may be utilized, all capable of causing eye, contusion, and laceration hazards.

Working surfaces that are slippery can increase the likelihood of back injuries, overexertion injuries, and slips and falls. All personnel should frequently inspect working surfaces and keep working surfaces clear of debris and moisture.

2.1.3 Hazard and Contaminant Control

For each field task, Level D PPE is to be worn initially. Safety-toe boots with metatarsal protection are a minimum requirement for work. Overboots or boot covers should also be used to minimize the potential of

tracking COCs from the work zone to other areas of the Site. Eye protection will be worn to minimize splashing into eyes. The specific requirements for Level D PPE are presented in Section 4.

If odors are observed during field activities, air monitoring with a PID should be conducted to evaluate the concentrations that are present. Action levels for upgrading PPE are presented in the JSAs provided in [Appendix A](#).

Field equipment will be inspected and in proper working condition. Mechanical assistance will be provided for large lifting tasks. Ground Fault Circuit Interrupter (GFCI) will be used on all electric power tools and extension cords in outdoor work locations. Electrical extension cords will be protected or guarded from damage (*i.e.*, cuts from other machinery) and be maintained in good condition.

OBG personnel will not operate chainsaws; however, subcontractors will be reminded of safe operating practices. Face shields, cut resistant gloves, and safety glasses will be required for all chain saws, weed trimmers, and similar tools. Kevlar chaps and jackets will be required for chainsaw work.

2.2. TASK HAZARDS

Hazard controls for task hazards will identify PPE as described in more detail in Section 4 of this HASP. Other safety controls and safety procedures will also be referenced as necessary to mitigate task hazards.

2.2.1 Soil Boring Advancement, Test Pitting Activities, Surface Soil Sampling, Soil Vapor Sampling, and Groundwater Monitoring Well Installation Field Activities

Field operations will consist of well and soil boring advancement, test pit excavations, surface soil sampling, soil vapor sampling, and sampling for groundwater and sub-surface soil samples. The physical hazards of this operation are primarily associated with operation of the coring equipment, drilling equipment, and contact with material brought up from the subsurface during drilling.

Drill cuttings will temporarily be placed in a 55 gallon drum at the drilling location. The drum will then be moved using a skid-steer and the soils will be containerized in a 12 cubic yard roll-off and temporarily staged at the Site at a location convenient for transportation to and from the Site. At the conclusion of field activities, these materials will be appropriately characterized and, after receiving the necessary approvals, will be transported off Site for treatment and/or disposal at a permitted facility.

Potential health hazards and contaminants

Hazards generally associated with coring and drilling operations include noise levels exceeding the OSHA PEL of 90 dBA that are both a hazard and a hindrance to communication, carbon monoxide from the drill rig, and overhead electrical and telephone wires which can be hazardous when the drill rig boom is in the upright position. Moving parts on the drill rig may catch clothing. Free or falling parts from the cat head may cause head injury. High pressure hydraulic lines and air lines used on drill rigs are hazardous when they are in disrepair or incorrectly assembled. There may be underground utilities in the area where drilling is being performed.

During the retrieval of augers/drilling rods, the possibility exists for splashing of exposed subsurface materials onto the workers and release of dust containing PCBs and volatile materials onto workers' bodies and into the workers' breathing zones.

There is the potential for arm and back strain during the purging of the groundwater monitoring wells.

Operation of gas-powered drilling rigs or other equipment without proper controls and/or venting may cause a build-up of carbon monoxide and other gasses that may be hazardous.

OBG personnel will not enter excavations until a daily inspection has been performed by a qualified Excavation competent person that has National Underground Utility Contractors Association (NUCA) training or equivalent and is authorized by OBG as such. The daily inspection must confirm that sloping or shoring meets OSHA requirements and is documented in writing using OBG's Daily Excavation Checklist. Unless a soil analysis is performed and documented on OBG's "Soil Analysis Checklist" (or equivalent), soil is assumed Type C with a required sloping of 1.5H:1V. OBG personnel shall not enter an excavation greater than 4 ft. deep unless walls are

sloped so that persons can easily walk in or out of the excavation. Excavations greater than 4 ft. deep which are not sloped so that persons can easily walk in or out will be classified as confined spaces. These excavations will be considered by OBG as permit-required confined space unless re-classified in accordance with OBG's confined space entry procedure. The subcontractor is responsible for utility clearance. Maintain a safe distance from moving/operating machinery during oversight of excavation.

OBG's Corporate Health, Safety & Environment Manual (Appendix B, Safe Work Procedures, Excavation) section on Excavation will be reviewed by field personnel prior to start of work. The Daily Excavation Checklist ([Attachment 3](#)) to be used as a tool to evaluate & document entry conditions for OBG personnel.

Hazard and contaminant control

General PPE requirements presented in Section 4 apply to this task. Personnel must wear Level D PPE including ear muffs and/or ear plugs when working near operating heavy machinery. Modified Level D PPE will be worn during drilling and when there is a need to handle or work with potentially impacted soil or liquid. Prior to approaching a drill rig, loose clothing will be secured and the boom position will be checked.

When outdoor activities are completed, personnel will remain upwind from the vehicle exhausts unless required by sampling work. Wet methods should be used when coring concrete or other hard surfaces. During drilling, if wet methods are not used, air in the breathing zone of the worker will be monitored for total dust using a real-time air meter (RAM) at approximately five-minute intervals. Air will be screened for volatile organic vapors using a PID at approximately five-minute intervals. Subsequent monitoring and respirator wear will be in accordance with Section 3 of this HASP.

The drilling subcontractor will be required to inspect chains, lines, cables, and high-pressure lines daily for weak spots, frays, and other signs of wear. The drilling subcontractor will be required to make repairs as necessary. To avoid contact with overhead lines, the drilling subcontractor will be required to lower the drill rig boom prior to moving the rig. The drilling subcontractor will be required to verify the location of underground utilities with the local power and utility companies prior to drilling. Overhead and underground utilities will be considered "live" until verified otherwise.

Back strain can be prevented by employing proper lifting and bailing techniques. Heavy equipment, such as pumps and generators, will only be lifted with the legs, preferably using two or three personnel.

Equipment that is potentially contaminated will be cleaned to the satisfaction of the Field Operations Manager or SSHO. The field sampling equipment will be cleaned and decontaminated using the equipment decontamination procedures outlined in the Field Sampling and Analysis Plan (FSAP). The field decontamination wastes will be collected and disposed of properly according to the FSAP.

2.2.2 Groundwater Sampling

Monitoring wells will be installed in accordance with the RI Work Plan and FSAP. Potentially contaminated groundwater will be generated during groundwater sampling activities. The water will initially be placed in a 55 gallon drum, then will be moved using a skid-steer and the water will be containerized in a 6,900 gallon frac tank and temporarily staged at the Site at a location convenient for transportation to and from the Site. At the conclusion of field activities, these materials will be appropriately characterized described above and, after receiving the necessary approvals, will be transported off Site for treatment and/or disposal at a permitted facility.

Potential health hazards and contaminants:

Potential health hazards and contaminants are consistent with those identified in previous sections. Additional exposures include contact with preservatives in laboratory sample bottles during the collection of groundwater water samples.

Hazard and contaminant control:

Hazards and contaminant control are consistent with those in previous sections. Initially, Modified Level D PPE, to prevent contact with groundwater, sample bottle preservatives, will be provided.

Employing proper lifting and bailing techniques while developing wells and sampling wells will prevent back strain. Heavy equipment, such as pumps and generators, will only be lifted with the legs, preferably using two or three personnel.

3. PERSONNEL TRAINING

3.1 FIELD WORKERS

OBG employees and subcontractors performing the activities listed in the RI Work Plan must have completed a training course of at least 40 hours meeting the requirements of 29 CFR 1910.120(e) for safety and health at hazardous waste operations. If the course was completed more than 12 months before the date of work, completion of an approved, 8 hour, refresher course on health and safety at hazardous waste operations is required.

3.2 MANAGEMENT AND SUPERVISORS

In addition to the requirements described in Section 3.1 for OBG field workers, OBG field supervisors performing on-Site operations must have completed a training course of at least 8-hr meeting the requirements of 29 CFR 1910.120(e) on supervisor responsibilities for safety and health at hazardous waste operations.

3.3 EMERGENCY RESPONSE PERSONNEL

OBG employees who respond to emergency situations involving health and safety hazards must be trained in how to respond to such emergencies in accordance with the provisions of 29 CFR 1910.120(l). Skills such as cardiopulmonary resuscitation (CPR), mouth-to-mouth rescue breathing, and basic first aid skills may be necessary. Personnel who respond to emergencies on-Site will be briefed on potential hazards by the SSHC before being permitted to enter the buffer and exclusion zones.

3.4 PROJECT SPECIFIC TRAINING

Project-specific training will be provided to each OBG employee and reviewed before implementing field assignments. OBG personnel will be briefed daily by the Site Supervisor or by the SSHC as to the potential hazards that may be encountered during that day. Topics will include:

- Availability of this HASP;
- General hazards and specific hazards in the work areas;
- Selection, use, testing, and care of the body, eye, hand, foot and respiratory protective equipment being worn and the limitations of each;
- Emergency response procedures and requirements;
- Emergency notification procedures and evacuation routes to be followed; and,
- Procedures for obtaining emergency assistance and medical attention.

3.5 TRAINING CERTIFICATION

A record of employee training completion will be maintained by the SSHC for each OBG employee who is trained. This record will include the dates of the completion of worker training, supervisor training, refresher training, emergency response training, and specific training for on Site OBG employees. Copies of OSHA certificates will also be obtained from prevailing wage subcontractors entering the Site and kept on file.

4. PERSONNEL PROTECTION

The basic level of personal protective equipment (PPE) to be used during field activities associated with implementation of the RI is OSHA Level D. PPE may be upgraded based on air monitoring results or at the discretion of the Project Manager and based on the SSHC's recommendations. A downgrade of PPE must be approved by the SSHC and the Project Manager.

If the SSHC determines that field measurements or observations indicate that a potential exposure is greater than the protection afforded by the equipment or procedures specified in this or other sections of this HASP, the work will be stopped. OBG personnel will be removed from the Site until the exposure has been reduced or the level of protection has been increased.

OBG employees who are required to wear respiratory protection on this project will have been medically approved, fit tested for, and trained in the use of the assigned respiratory protection equipment. Respirators issued are approved for protection against dust and organic vapors by the National Institute for Occupational Safety and Health (NIOSH). Respirators are issued for the exclusive use of one worker and will be cleaned and disinfected after each use by the worker. Respirator users must check the fit of the respirator before each day's use to see that it seals properly. The respirator must seal against the face so that the wearer receives air only through the air purifying cartridges attached to the respirator. No facial hair that interferes with the effectiveness of a respirator will be permitted on personnel required to wear respiratory PPE. Cartridges and filters for air-purifying respirators in use will be changed at the end of each workday that an air-purifying respirator is worn, unless the SSHC determines that a more frequent changeout schedule is necessary, as in the case of high concentrations leading to breakthrough or saturation of the filters.

4.1 PROTECTIVE EQUIPMENT DESCRIPTION

The level of PPE is categorized as Level A, B, C, or D, based upon the degree of protection required. For each level, hard hats will be required if dangers related to overhead objects may be present. For drilling and test pitting activities, hard hats will be worn at all times. For other tasks, hard hats will be worn, as necessary. The following is a brief summary of the PPE levels that may be used on this site.

Level C - The concentration(s) and type(s) of airborne substance(s) is known and the criteria for using air-purifying respirators are met. The following constitute Level C equipment:

- NIOSH approved full-face air purifying respirator with organic vapor/acid gases cartridges and P100 filters;
- Chemical-resistant clothing (polyethylene coated overalls, chemical-splash suit, disposable chemical-resistant overalls) with ankles and cuffs taped closed;
- Gloves, outer, nitrile, chemical-resistant;
- Gloves, inner, nitrile, chemical-resistant;
- Shoes, with safety-toe and shank meeting ANSI requirements plus metatarsal protection;
- Boots, outer neoprene or chemical resistant (latex or neoprene) boot covers;
- Hearing protection, if necessary
- Hard hat, if necessary; and,
- Face shield when not wearing a full-face respirator.

Modified Level D - A work uniform providing additional skin protection when respiratory protection is not necessary. The following constitute Modified Level D equipment:

- Chemical-resistant clothing (polyethylene coated overalls, chemical-splash suit, disposable chemical-resistant overalls) with ankles and cuffs taped closed;
- Gloves, outer, nitrile, chemical-resistant;
- Gloves, inner, nitrile, chemical-resistant;

- Shoes, with steel toe and shank meeting ANSI requirements plus metatarsal protection;
- Boots, outer neoprene or chemical resistant (latex or neoprene) boot covers;
- Hearing protection, if necessary
- Hard hat, if necessary;
- Escape mask (optional);
- Face shield when not wearing other eye protection; and
- Filtering respirator (*i.e.*, dust mask) voluntary use.

Level D - A work uniform affording minimal protection, used for nuisance contamination only. The following constitute Level D equipment:

- Coveralls or other appropriate work clothing;
- Shoes, with safety toe and shank meeting ANSI requirements plus metatarsal protection;
- Optional chemical resistant boot covers;
- Safety glasses or chemical splash goggles;
- Gloves, nitrile if handling wet materials;
- Hearing protection, if necessary;
- Hard hat, if necessary;
- Escape mask (optional); and
- Filtering respirator (*i.e.*, dust mask) voluntary use.

4.2 PROTECTIVE EQUIPMENT FAILURE

If an individual experiences a failure or other alteration of PPE that may affect its protective ability, that person is to leave the work area immediately. The Project Manager or the SSHC must be notified and, after reviewing the situation, is to determine the effect of the failure on the continuation of on-going operations. If the Project Manager or the SSHC determine that the failure affects the safety of workers, the work site, or the surrounding environment, workers are to be evacuated until corrective actions have been taken. The SSHC will not allow re-entry until the equipment has been repaired or replaced and the cause of the failure has been identified.

5. MEDICAL MONITORING

5.1 MEDICAL SURVEILLANCE PROGRAM

OBG has implemented a medical monitoring program in accordance with 29 CFR 1910.120. The OBG program is designed to monitor and reduce health risks to employees potentially exposed to hazardous materials and to provide baseline medical data for each employee involved in work activities. It is also designed to determine the employee's ability to wear personal protective equipment such as chemical resistant clothing and respirators.

Medical examinations are administered on a post-employment and annual basis and as warranted by symptoms of exposure or specialized activities. The examining physician is required to make a report to OBG of any medical condition that would increase the employee's risk when wearing a respirator or other PPE. OBG maintains site personnel medical records as required by 29 CFR 1910.120 and by 29 CFR 1910.1020, as applicable.

OBG employees performing the activities listed in the RI Work Plan of this document have or will receive medical tests as regulated by 29 CFR 1910.120. Where medical requirements of 29 CFR 1910.120 overlap those of 29 CFR 1910.134, the more stringent of the two will be enforced.

5.2 RESPIRATOR CLEARANCE

Employees who wear or may wear respiratory protection have been provided respirators as required by 29 CFR 1910.134. This standard requires that an individual's ability to wear respiratory protection be medically certified before performing designated duties.

6. AIR MONITORING

Field activities associated with the investigation may cause potentially hazardous conditions, through the volatilization of hazardous substances. These substances may be in the form of vapors, dusts, or mists that can enter the body through ingestion, inhalation, adsorption and direct contact. Monitoring of these substances will be performed to ensure appropriate personal protective measures are employed during Site activities.

Action levels have been established for activity cessation, Site evacuation, emergency response, and determination of personal protection levels. Section 4 discusses the minimal personal protection required for specific Site activities. **Tables 6-4(a)** and **6-4(b)** below lists action levels, airborne concentrations, and associated personal protection levels. Changes to these specified levels are dependent on the results of air monitoring, as described below and must be approved by the Corporate Associate for Safety and Health.

Personal monitoring must be conducted in the breathing zone and, if workers are wearing respiratory protective equipment, outside the face piece.

6.1 FIELD INSTRUMENTATION AND SAMPLING

Field health and safety air sampling for the RI field investigation will consist of organic vapor monitoring using a photoionization detector (PID) according to provisions of Section 2. In addition, during intrusive activities, a dust meter shall be used to monitor for the presence of total particulates. Dust monitors shall be placed upwind and downwind of work activities, and within the work zone. Dust meters will be capable of measuring particulate matter less than 10 micrometers in size (PM-10) and capable of integrating readings over a period of 15-minutes for comparison to the airborne particulate action level. In addition, dust generation and migration will be visually assessed during work activities.

Periodic organic monitoring will be conducted in the breathing zone and, if workers are wearing respiratory protective equipment, outside the face piece. The monitoring strategies may change if work tasks or operations change. Monitoring instruments will be checked for appropriate response, in accordance with the manufacturer's instructions, before use each sampling day.

6.2 ACTION LEVELS

Work zone monitoring action levels and Community Air Monitoring Plan (CAMP) action levels are provided below and in the JSA provided in **Appendix A**.

6.3 WORK ZONE MONITORING

The following work zone monitoring will be implemented during intrusive RI field activities, which will include exploratory test pits/excavations, drilling of soil borings, and installation of groundwater monitoring wells. An example Air Monitoring Log is presented as **Attachment 1**.

The breathing zone will be monitored periodically for VOCs. Should this monitoring indicate sustained VOC levels in the breathing zone above 5 ppm above background, then the monitoring will be increased to a continuous frequency, and the CAMP detailed in Section 6.4 will be implemented. Actions such as keeping the sampling upwind of motors and fuel areas will be implemented to reduce potential interference due to vapors that may be associated with motor operation. PPE will be upgraded to Level C which includes air purifying respirators and chemical resistant clothing (Section 4) when the VOC concentration in the respective breathing zone exceeds 5 ppm above background as indicated on the PID. If the measured VOC concentration is greater than or equal to 50 ppm above background, the workers will leave that work area. The breathing zone will also be monitored periodically for airborne particulates. Should this monitoring indicate sustained particulate concentrations above 100 micrograms per cubic meter ($\mu\text{g}/\text{m}^3$), then monitoring will be increased to a continuous frequency, and the CAMP will be implemented. In addition, particulate control measures will be initiated. Action levels for organic vapors and particulate emissions are outlined in the JSA as well as on **Table 6-4(a)** (below).

6.4 COMMUNITY AIR MONITORING PLAN

The following CAMP is provided and will be implemented during intrusive RI field activities, which will include exploratory test pits/excavations, drilling of soil borings, and installation of groundwater monitoring wells. An example Air Monitoring Log is presented as [Attachment 1](#).

The upwind and downwind perimeter of the exclusion zone will be monitored during intrusive work. A PID will monitor total organic vapors while a particulate meter will monitor particulate concentrations. The monitors will be equipped with audible and visual alarms, have recorders and display 15 minute time weighted averages. The equipment will not be connected remotely to smart phones, pagers, or the internet. All readings will be downloaded and available for New York State Department of Health (NYSDOH) and NYSDEC personnel to review upon request. Action levels for organic vapors and particulate emissions are outlined in the following subsections as well as in the JSA and on [Table 6-4\(b\)](#) (below).

6.4.1 Organic Vapors

If the 15-minute average VOC level remains below 5 ppm above background, intrusive work activities may continue. If the 15-minute average VOCs level exceeds 5 ppm above background, intrusive work activities will be suspended. Monitoring will continue under the provisions of the Vapor Emission Response Plan described below. If the 15-minute average VOCs level exceeds 25 ppm above background, intrusive work will be stopped and the Major Vapor Emissions Plan described below will be activated. Monitoring will continue under the provisions of the Major Vapor Emission Plan described below.

Vapor Emission Response Plan

If the vapor levels increase above 5 ppm above background at the downwind perimeter of the exclusion zone but remain below 25 ppm above background, work can resume provided:

- The source of the vapors has been identified and corrective actions have been taken to abate the emissions. These actions must reduce the exclusion zone perimeter emissions below 5 ppm;
- The organic vapor level 200 feet downwind of the work area or half of the distance to the nearest residential or commercial structure, whichever is less, is less than 5 ppm over background. If the distance to the nearest occupied building is less than 20 feet, the monitor will be placed at the perimeter of the work area; and
- Continuous monitoring continues.

Major Vapor Emission Plan

If organic levels greater than 5 ppm over background are identified 200 feet downwind from the work area or half of the distance to the nearest residential or commercial property, whichever is less, all work activities at the Site will be halted.

If, following the cessation of the work activities, the downwind organic levels persist above 5 ppm above background, then the air quality must be monitored within 20 feet of the perimeter of the nearest residential or commercial structure (20-Foot Zone).

If efforts to abate the emission source are unsuccessful and if organic vapors persist at levels ≥ 5 ppm for more than 30 minutes or any level ≥ 10 ppm in the 20-foot Zone, then the following actions will be taken:

- 1) Monitoring will be conducted continuously in the "20 foot zone" until VOC levels are below 5 ppm. All intrusive site activities will be halted during this time;
- 2) The City will be notified; and
- 3) The NYSDEC will be notified.

6.4.2 Dust/Particles

When the 15-minute average dust level remains below 0.1 milligrams per cubic meter (mg/m^3) above background, intrusive work activities may continue.

If the downwind PM-10 particulate level is 0.1 mg/m^3 greater than background (upwind perimeter) for the 15-minute period or if airborne dust is observed leaving the work area, then dust suppression techniques must be employed.

If, after implementation of dust suppression techniques, downwind PM-10 particulate levels are greater than 0.15 mg/m^3 above the upwind level, work must be stopped and a re-evaluation of activities initiated. Work can resume provided that dust suppression measures and other controls are successful in reducing the downwind PM-10 particulate concentration to within 0.15 mg/m^3 of the upwind level and in preventing visible dust migration.

Particulate Emission Response Plan

If the particulate levels increase above 0.1 mg/m^3 over background at the downwind perimeter of the exclusion zone but remain below 0.15 mg/m^3 above background, work can resume provided dust suppression techniques are employed and no visible dust is migrating from the work area.

If the particulate levels increase above 0.15 mg/m^3 over background at the downwind perimeter of the exclusion zone, work can resume provided dust suppression measures and other controls are successful in reducing the downwind PM-10 particulate concentration to within 150 micrograms per cubic meter ($\mu\text{g/m}^3$) of the upwind level and in preventing visible dust migration.

Table 6-4(a) WORK ZONE ACTION LEVELS

Contaminant (equipment/method)	Frequency	Breathing Zone Action Levels*	SSHC Action/Response
<p>Volatile Organic Vapors</p> <p>Odor observations and PID (PID with 10.6 eV lamp)</p>	<p>1. Continuously in breathing zone during intrusive work activities.</p> <p>2. When observations of any unusual odors are reported to the SSHC.</p>	<p><5 ppm</p>	<p>1. Level D PPE (General PPE).</p> <p>2. Work may continue.</p>
		<p>≥5 ppm</p>	<p>1. STOP work.</p> <p>2. Implement additional engineering (minimize open area) or administrative controls (await dissipation) to reduce contaminant concentrations below action level(s). Alternatively, work may also continue with air purifying respirators with organic vapor/P100 filters and an upper threshold for their use (Benzene permissible exposure limit 1.0 ppm x protection factor of 10 = 10 ppm).</p> <p>3. Work may continue if readings are <5 ppm and additional vapor controls have been implemented.</p> <p>4. Monitoring must continue at the exclusion zone perimeter for as long as VOC levels are ≥5 ppm.</p>
		<p>>50 ppm</p>	<p>1. STOP work.</p> <p>2. Vacate area.</p> <p>3. Notify the OBG Project Manager, City Division of Environmental Quality (DEQ) Project Manager, and NYSDEC representative.</p>
<p>Dust</p> <p>Observations and Dust Meter (Dust Trak)</p>	<p>1. Continuously in breathing zone during intrusive work activities.</p> <p>2. When observations of any visible dust are reported to the SSHC.</p>	<p><0.1 mg/m³</p>	<p>1. Level D PPE (General PPE).</p> <p>2. Work may continue.</p>
		<p>0.1 – 0.15 mg/m³</p>	<p>1. STOP work.</p> <p>2. Implement additional engineering (minimize open area) or administrative controls (await dissipation) to reduce particulate concentrations below action level(s).</p> <p>3. Work may continue if readings are <0.1 mg/m³ and additional dust controls have been implemented.</p> <p>4. Monitoring must continue for as long as particulate levels are 0.1 – 0.15 mg/m³.</p>
		<p>>0.15 mg/m³</p>	<p>1. STOP work and evaluate alternate work methods or dust controls.</p> <p>2. Work may continue if readings are <0.15 mg/m³ and additional dust controls have been implemented.</p> <p>3. Immediately notify the OBG Project Manager, OBG Manager of Corporate Health and Safety, City DEQ Project Manager, and NYSDEC representative.</p> <p>4. Resume work if the cause of the elevated dust levels has been evaluated and corrective action has been identified.</p>

Table 6-4(b) COMMUNITY AIR MONITORING ACTION LEVELS

Contaminant (equipment/method)	Frequency	Downwind Action Levels*	SSHC Action/Response
Volatile Organic Vapors Odor observations and PID (PID with 10.6 eV lamp)	1. Continuously downwind during intrusive work activities. 2. When observations of any unusual odors are reported to the SSHC.	<5 ppm (at the exclusion zone perimeter)	1. Work may continue. 2. Readings shall be recorded and made available for NYSDEC/NYSDOH review.
		5 ppm (at the exclusion zone perimeter)	1. STOP work. 2. Move to a location 200' downwind or at half the distance between the exclusion zone and nearest dwelling (but not closer than 20') and continue air monitoring and recording readings at this location. If the VOC level at the downwind location is <5 ppm, return to the exclusion zone perimeter and take additional VOC readings. 3. Work may continue if exclusion zone perimeter readings are <5 ppm and additional vapor controls have been implemented. 4. Monitoring must continue at the exclusion zone perimeter for as long as VOC levels are ≥5 ppm.
		25 ppm (at the exclusion zone perimeter)	1. STOP work. 2. Implement additional vapor emission controls to reduce VOC levels below 5 ppm (at the exclusion zone perimeter). 3. Notify the OBG Project Manager, City DEQ Project Manager, and NYSDEC representative.
Dust Observations and Dust Meter (Dust Trak)	1. Continuously downwind during intrusive work activities. 2. When observations of any visible dust are reported to the SSHC.	<0.1 mg/m ³ (at the exclusion zone perimeter)	1. Work may continue. 2. Readings shall be recorded and made available for NYSDEC/NYSDOH review.
		0.1 – 0.15 mg/m ³ (at the exclusion zone perimeter)	1. Work may continue but use dust suppression controls.
		>0.15 mg/m ³ (at the exclusion zone perimeter)	1. STOP work. 2. Work may continue if exclusion zone dust readings are <0.15 mg/m ³ and additional dust controls have been implemented. 3. Immediately notify the OBG Project Manager, OBG Manager of Corporate Health and Safety, City DEQ Project Manager, and NYSDEC representative. 4. Work will not restart until the cause of the elevated dust levels has been evaluated and corrective action identified.

* Sustained readings for 1-minute above background. Background readings are taken at upwind locations relative to exclusion zones.

7. SITE CONTROL

7.1 SITE SECURITY

Site security will be monitored and controlled by the Project Manager, the Site Supervisor, and the SSHC. Their duties will include limiting access to the work area to authorized personnel, overseeing project equipment and materials, and overseeing work activities. The procedures specified below will be followed to control access to each work site to prevent persons who may be unaware of site conditions from exposure to hazards. Work area control procedures may be modified as required by site conditions.

7.2 SITE CONTROL

Portions of the Site have access to the Bicycle Path. Encountering pedestrians utilizing the Bicycle path or walking trails are a possibility. Signage will be used to detour pedestrians if drilling is to be performed or equipment is to be driven or moved on or near the pathway. Traffic cones and signage will be utilized around the drill rig or machinery to warn pedestrians if in an active pathway.

Work zones will be required during Site activities identified in this HASP. The following two categories of work zones will be established at each sampling point: an exclusion zone and a buffer zone. The remainder of the Site will be the support zone.

7.2.1 Exclusion Zone

The exclusion zone is where sampling activities are conducted. The SSHC will identify this zone. It must be at least 30 ft. in diameter and centered on the work activities.

7.2.2 Buffer Zone

The buffer zone contains personnel and equipment decontamination stations and staging areas for samples. The buffer zone will be located upwind of the work activities. It will only be large enough to contain equipment and personnel necessary to keep potentially contaminated media and materials in the immediate work area.

7.2.3 Support Zone

The remainder of the area is defined as the support zone. The support zone contains support facilities, extra equipment, transport vehicles, and additional personnel and equipment necessary to manage and perform work activities.

7.3 WORK ZONE ACCESS PROCEDURES

Work zone access during field activities will be limited to those personnel required. Such personnel are anticipated to include, but will not necessarily be limited to, OBG employees or subcontractors, City of Rochester personnel involved in the project, and those representatives as designated by the NYSDEC or local agencies. Site access will be monitored by the SSHC, who will maintain a log-in sheet (presented as [Attachment 2](#)). The log will include OBG and other personnel on the Site, their arrival and departure times and their destination on the Site.

7.4 SITE COMMUNICATIONS

A cellular telephone will be used during activities to facilitate communications for emergency response and other purposes and to serve as the primary off-Site communication network.

7.5 CONFINED SPACE ENTRY

No entry of permit required confined spaces is expected while OBG personnel perform the tasks listed in the RI Work Plan. A confined space is defined as a space that has limited or restricted means for entry (for example tanks, vessels, silos, storage bins, hoppers, vaults, and pits), is not designed for continuous employee occupancy, and large enough to enter.

8. DECONTAMINATION

8.1 PERSONNEL DECONTAMINATION PROCEDURES

Decontamination procedures are required only if the work being performed results in contaminated protective equipment, and will be required for footwear of all personnel leaving the Site. OBG personnel leaving an exclusion zone will decontaminate their protective equipment within the buffer zone before entering the support zone. Decontamination involves removal of contaminated disposable protective garments and/or scrubbing with a non-phosphate detergent and potable water solution followed by a rinse with potable water.

All personnel leaving the Site will undergo footwear decontamination prior to leaving the Site. This will consist of a boot wash using a soapy water (*e.g.*, Alconox) brush of footwear, followed by a potable water rinse. The wash and rinse water will be containerized and managed as IDW as detailed in Section 11.3.1 of the FSAP. The personnel decontamination area will be located on City-owned land immediately north of Flint Street (a continuation of the 1320 S. Plymouth Avenue tax parcel) as depicted on [Figure 6](#). A shipping container may also be staged near the decontamination or IDW area for storage.

Decontamination will take place on a decontamination pad. Dirt or other foreign materials that are visible will be removed from surfaces. Scrubbing with a brush may be required to remove materials that adhere to the surfaces. Waste waters from personnel decontamination will be handled with the waste waters from equipment decontamination. The decontamination procedures will be modified based on the potential level of contamination. The SSHC will be responsible for determining the appropriate level of decontamination.

Disposable protective equipment generated during the field activities will be containerized in a lined waste receptacle and subsequently disposed of properly. Personnel will wash hands thoroughly prior to eating or drinking in the support zone.

8.2 EMERGENCY DECONTAMINATION PROCEDURES

The extent of emergency decontamination depends on the severity of the injury or illness and the nature of the contamination. Minimum decontamination will consist of detergent washing, rinsing and removal of contaminated outer clothing and equipment. If time does not permit the completion of all of these actions, it is acceptable to remove the contaminated clothing without washing it. If the situation is such that the contaminated clothing cannot be removed, the person should be given required first aid treatment, and then wrapped in a blanket prior to transport to medical care. If heat stress is a factor in the victim's illness/injury, outer clothing will be removed from the victim immediately.

8.3 MONITORING EQUIPMENT DECONTAMINATION PROCEDURES

Non-disposable or non-dedicated monitoring equipment will be cleaned of visible contamination and debris before initial use on Site, between uses, and after final use. Non-disposable or non-dedicated monitoring equipment that contacts the soil or groundwater will be decontaminated after each use by scrubbing with a non-phosphate detergent and potable water solution followed by rinses with potable water and distilled water, as required.

Decontamination procedures for heavy equipment used for the drilling and installation of monitoring wells will be performed at a location designated by the Project Manager or SSHC. Decontamination involves potable water or steam cleaning on a decontamination pad that will contain rinse water and overspray. Heavy equipment will be thoroughly cleaned and inspected by the SSHC prior to leaving the Site.

Decontaminated or clean equipment not in use will be stored in a designated storage area in the support zone.

8.4 DECONTAMINATION SUPPLIES

The following supplies will be available on site for the decontamination of personnel and equipment:

- Plastic drop cloths;
- Plastic bags or DOT-approved fiberboard drums to collect non-reusable protective clothing;
- Plastic wash tubs;
- Soft bristled long-handle brushes;
- DOT-approved drums or appropriate other containers, to collect wash and rinse water;
- Hand spray units for decontamination;
- Non-phosphate detergent;
- Potable and distilled water;
- Soap, water, alcohol wipes, and paper towels to wash hands, faces, and respirators; and
- Washable tables and benches or chairs.

8.5 COLLECTION AND DISPOSITION OF CONTAMINATED MATERIALS

PPE and other investigation-derived wastes are to be collected, drummed, and disposed of in accordance with the procedures in the FSAP. Investigation derived waste will be managed as described in the FSAP.

8.6 GENERAL REFUSE DISPOSAL

General refuse such as food and beverage containers, paper, cardboard, and plastic products that do not contain hazardous substances from the Site or the Site work will be bagged or otherwise contained and will be properly disposed.

9. EMERGENCY RESPONSE

9.1 NOTIFICATION OF SITE EMERGENCIES

In an emergency, Site personnel will signal distress either by yelling or with three blasts from a horn (vehicle horn, air horn and so forth). The SSHC, Site Supervisor, or the Project Manager will immediately be notified of the nature and extent of the emergency.

Hospital Route directions and emergency telephone numbers are provided in the JSA ([Appendix A](#)).

9.2 RESPONSIBILITIES

The SSHC is responsible for responding to or coordinating the response of emergency personnel to emergencies and will notify the Project Manager and Project Coordinator immediately of emergencies. In the event of an emergency, the SSHC will direct notification and response, and will arrange follow-up actions. Upon notification of an exposure incident, the SSHC will dial the appropriate telephone number listed in [Table 1-1](#) and request hospital, fire, and/or police emergency personnel be dispatched to the location of the emergency.

Response personnel will, as necessary, recommend medical diagnosis, treatment, and provide transportation to the hospital. Before work may resume following an emergency, used emergency equipment must be recharged, refilled, or replaced and government agencies must be notified as required.

9.3 ACCIDENTS, INJURIES, AND NEAR MISSES

In the event of an accident or injury, workers will immediately implement emergency isolation measures to assist those who have been injured and to protect others from hazards. Upon notification of any accident or injury, the SSHC will immediately contact the Project Manager, and the Project Manager will notify the Project Coordinator. If necessary, immediate medical care will be provided by personnel trained in first aid procedures.

Near-miss incidents must also be reported immediately to the Project Manager. Near-miss incidents are cases in which no injury or property damage occurred. However, an injury or property damage could have occurred under similar conditions.

The Project Manager, assisted by the SSHC, must investigate the accident, injury, or near-miss as soon as possible. The Project Manager will assess accident, injury, or near-miss, the cause, and the means to prevent similar incidents. The resulting report must be signed and dated by the Project Manager and the SSHC. In addition, the OBG Corporate Associate for Safety and Health will be notified within 24-hours of an accident involving OBG personnel and/or its subcontractors.

9.4 SAFE REFUGE

Before commencing Site activities, the SSHC will identify the location that will serve as the place of refuge for OBG workers in case of an emergency evacuation. During an emergency evacuation, personnel in the exclusion zone should evacuate the work area both for their own safety and to prevent hampering rescue efforts. Following an evacuation, the SSHC will account for site personnel.

9.5 FIRE FIGHTING PROCEDURES

A fire extinguisher meeting the requirements of 29 CFR Part 1910 Subpart L, as a minimum, will be available in the support zone during on site activities. This is intended to control small fires. When a fire cannot be controlled with the extinguisher, the exclusion zone will be evacuated, and the fire department will be contacted immediately. The SSHC or the Site Supervisor will determine when to contact the fire department.

9.6 EMERGENCY EQUIPMENT

The following equipment, selected based on potential site hazards, will be maintained in the support zone for safety and emergency response purposes:

- Cell phone;

- Fire extinguisher (when fuel-powered engines or other flammable materials are present); and
- First aid kit with eye wash bottles.

9.7 EMERGENCY SITE COMMUNICATIONS

Hand and verbal signals will be used at the site. Portable telephones will be available during site activities for emergency response communications.

9.8 SECURITY AND CONTROL

Work zone security and control during emergencies, accidents, and incidents will be monitored by the SSHC or the Site Supervisor. The duties of the SSHC or the Site Supervisor include limiting access to the work zones to authorized personnel and overseeing emergency response activities.

10. SPECIAL PRECAUTIONS AND PROCEDURES

The activities listed in the RI Work Plan may expose personnel to both chemical and physical hazards. The hazards associated with specific site activities are discussed in Section 2 and the attached JSA ([Appendix A](#)). The potential for exposure to hazardous situations will be significantly reduced through the use of air monitoring, PPE, hazard awareness training, and administrative and engineering controls. Other general hazards that may be present on a hazardous waste work site are discussed below.

10.1 COLD STRESS

The Project Manager and the SSHC will establish an appropriate work-warming regimen to avoid excessive exposure to cold temperatures that could result in cold stress. Employees can work in very cold conditions as long as they have the proper clothing and good areas to warm themselves frequently. Cold stress for extended periods of time can result in hypothermia. Hypothermia is a result of a drop in body temperature from 98.6°F (normal oral body temp.) to 96.8°F or below. Severe hypothermia can result in death. Employees must be trained in cold stress, take breaks when symptoms of cold stress are observed, and not return to work after the onset of cold stress unless fully recovered.

The most obvious symptoms of cold stress include pain in one's finger tips, toes and extremities and severe shivering; these symptoms can be alleviated by taking breaks in a warming area. More serious symptoms, which require medical attention prior to returning to work, include clouded consciousness, progressive loss of consciousness, stop of shivering, breathing decreases, unconsciousness and/or heart attack.

It is important to recognize the effect of wind speed on the perceived decrease in air temperature felt by the body on exposed skin. The table below provides estimated wind chill temperatures based on air temperature and wind speed. Wind chill must be taken into account when following the procedures to prevent cold stress provided below.

Minimum procedures to be followed to prevent cold stress include the following:

- If an employee becomes immersed in water or their clothing becomes wet during cold temperatures (below 35°F/2°C), then the employee should immediately get a new change of clothing and be evaluated for hypothermia;
- If an employee gets wet feet when the temperature is below 50°F, then they should get dry foot apparel as soon as possible;
- If the air temperature (taking wind chill into account based on the table below) falls below 32°F (0°C), insulating gloves should be used; and
- If prolonged work in 20°F (-7°C) temperatures (or below) is necessary, a work-warming regimen shall be established.

Table 10-1: Wind Chill Chart (Temperature vs. Wind Speed)

Wind Speed-mph							
Calm	5	10	15	20	25	30	35
Temperature (°F)	Wind Chill						
45	43	34	29	26	23	21	20
40	37	28	23	19	16	13	12
35	32	22	16	12	8	6	4
30	27	16	9	4	1	-2	-4
25	22	10	2	-3	-7	-10	-12
20	16	3	-5	-10	-15	-18	-20
15	11	-3	-11	-17	-22	-25	-27
10	6	-9	-18	-24	-29	-33	-35
5	0	-15	-25	-31	-36	-41	-43
0	-5	-22	-31	-39	-44	-49	-52
-5	-10	-27	-38	-46	-51	-59	-64
-10	-15	-34	-45	-51	-59	-64	-67
-15	-21	-40	-51	-60	-66	-71	-74
-20	-26	-46	-58	-67	-74	-79	-82
-25	-31	-52	-65	-74	-81	-86	-89

10.2 HEAT STRESS

The Project Manager and the SSHC will establish an appropriate work regimen to avoid excessive exposure to hot temperatures that could result in heat stress. Employees should be aware of the symptoms of heat stress with themselves and co-workers. Some symptoms associated with heat stress are:

- An elevated heart rate, lack of concentration, difficulty focusing on a task, fatigue;
- Irritability and/or sickness;
- Cramps, rash, headache;
- Loss of desire to drink water;
- Fainting;
- Skin clammy, moist and pale (severe heat exhaustion); and
- Skin extremely dry and red (heat stroke).

To help prevent heat stress, employees should intake plenty of water throughout the work day (sometimes as much as a quart per worker per hour) and employees should know where drinking water is located. Employees should adjust their work pace and expectations on how much work can be done during periods of high heat. If possible, heavy work should be scheduled during the cooler parts of the day (*i.e.*, early morning) and rest periods should be taken in cool areas for longer periods. Employees using PPE (*e.g.*, Tyvek® suits or other equipment which may retain heat) can be more susceptible to heat stress due to the fact that heat/sweat often cannot escape the suits and/or the equipment.

For instances of *mild heat stress*: Immediately bring employee to a cool place and have them rest and drink liquids. Provide off Site medical attention for employees who do not fully recover within one hour. For instances of *severe heat stress/heat stroke*: If an employee faints, experiences coordination problems or appears confused or disoriented, then immediately contact emergency services. If employee is suspected of heat stroke, soak employee in their clothes in cool water and contact emergency services.

It is important to recognize the effect of humidity on the perceived increase in air temperature felt by the body. The body cools itself through the evaporation of sweat. Humidity reduces the evaporation rate, which results in

lower rates of heat removal from the body. The table below provides estimated heat index temperatures based on air temperature and relative humidity. Workers must be aware of heat index and heat-related disorders.

Table 10-2: Heat Index Chart
Temperature (°F) vs. Relative Humidity

	10%	15%	20%	25%	30%	35%	40%	45%	50%	55%	60%	65%	70%	75%	80%
115	111	115	120	127	135	143	151								
110	105	108	112	117	123	130	137	143	151						
105	100	102	105	109	113	118	123	129	135	142	149				
100	95	97	99	101	104	107	110	115	120	126	132	136	144		
95	90	91	93	94	96	98	101	104	107	110	114	119	124	130	136

Heat Index/Heat Disorders	
Heat Index	Possible heat disorders for people in higher risk groups
DANGER 130 or higher	Heatstroke/sunstroke highly likely with continued exposure. <ul style="list-style-type: none"> • Moderate and strenuous outdoor activity prohibited
WARNING 105-130	Sunstroke, heat cramps or heat exhaustion likely, and heat stroke possible with prolonged exposure and/or physical activity. <ul style="list-style-type: none"> • Strenuous outdoor activity while wearing Tyvek is prohibited without the use of personal cooling devices. • Workers must drink every 15 minutes or more frequently at their discretion • Air conditioned break areas must be available.
CAUTION 90-105	Sunstroke, heat cramps and heat exhaustion possible with prolonged exposure and/or physical activity. <ul style="list-style-type: none"> • Strenuous outdoor activity while wearing Tyvek is prohibited above a HSI of 99 without the use of personal cooling devices and is recommended for lower HSI. • SSHC to monitor employees for symptoms of heat stress. • Workers must drink every 30 minutes or more frequently at their discretion. • Air conditioned break areas must be made available for morning, lunch, and afternoon breaks.
CONCERN 75-90	Fatigue possible with prolonged exposure and/or physical activity. <ul style="list-style-type: none"> • SSHC to monitor employees for symptoms of heat stress. • Workers must drink every 60 minutes or more frequently at their discretion. • Shaded break areas must be made available for morning, lunch, and afternoon breaks. Air conditioning is recommended.

Source: National Weather Service [Modified – The initial HSI for the lowest (“CONCERN”) heat stress category was reduced from 80 to 75 because of the potential for increased heat stress when wearing Tyvek.]

10.3 NATURAL HAZARDS

Lightning storms, hurricanes, tornadoes, and severe snow storms, all of which are obviously unavoidable and uncontrollable, may be treated as a natural disaster. In the event of severe weather conditions, Site work will be halted by the SSHC or designee. Site evacuation may take place and the Site shall be secured to the extent possible.

10.4 HEAVY EQUIPMENT / MACHINERY

OBG employees performing Site activities may use or work near operating heavy equipment and machinery and must be familiar with and review OBG’s Corporate Health, Safety & Environment Manual (Appendix B, Safe Work Procedures, Excavation) section on Excavation. Since protective equipment may reduce peripheral vision,

hearing or general awareness of the wearer, OBG personnel should exercise extreme caution in the vicinity of operating equipment and machinery to avoid physical injury to themselves or others. Cell phones will not be used while operating heavy equipment and machinery or by workers on the ground in the area of heavy equipment and machinery operations to avoid physical injury to themselves or others.

Site Personnel working near heavy equipment will be exposed to "struck-by" injuries and "crush" injuries if caught between heavy equipment (or counterweights) and a fixed object. Hydraulic line pressures may be as high as 6,000 pounds per square inch (psi). Special care should be taken when handling hydraulic hoses. Hoses lying on the ground shall be marked by cones to minimize the tripping hazard.

All equipment must be secured after hours. Keys must be removed from equipment and secured away from the equipment. Mobile equipment that does not require an ignition key shall be disabled. All vehicles and heavy equipment must be turned off when left unattended.

Subcontractors shall submit a letter on company letterhead that designates which of their employees is competent and authorized to operate each type of equipment present on this project. Forklift and lull operators must have a license or certificate that indicates they have passed a written test and "road" test for the type of forklift they will be operating.

Operators will use seatbelts if so equipped. Heavy equipment will be equipped with overhead and rollover protection whenever feasible. Operators will inspect equipment daily and document leaks, damage, and other necessary repairs.

Heavy equipment must be equipped with backup alarms, horns, and other safety devices installed by the manufacturer. Vehicles operated at night must have headlights, tail lamps, and reflectors. Safety devices must not be disabled.

10.5 ADDITIONAL SAFETY PRACTICES

The following are important safety precautions that will be enforced during the completion of the activities listed in Section 2:

- Eating, drinking, chewing gum or tobacco, smoking, or any practice that increases that probability of hand-to-mouth transfer and ingestion of material is prohibited in exclusion zone and buffer zones;
- Working under the influence of any illegal drug, prescription medication that may affect your ability to work, alcohol, or an illness that affects your ability to work or could potentially infect others on site is prohibited;
- Hands must be thoroughly washed before eating or drinking;
- No firearms may be brought on-Site;
- Contact with potentially-contaminated surfaces should be avoided whenever possible;
- Activities in an exclusion zone will be conducted using the "buddy system." The "buddy" is another worker fully dressed in the appropriate PPE who can perform the following activities:
 - » Provide partner with assistance
 - » Observe partner for sign of chemical or heat exposure
 - » Periodically check the integrity of partner's PPE
 - » Notify others if emergency help is needed
- Avoid breathing chemical odors;
- Do not expose skin to water, chemicals, or soil. If one becomes dirty or wet with contaminated fluids, clean up immediately using plenty of water;
- Unsafe or inoperable equipment left unattended will be identified by a "DANGER, DO NOT OPERATE" tag; and
- The HASP will be reviewed frequently for its applicability to the current and upcoming operations and

activities.

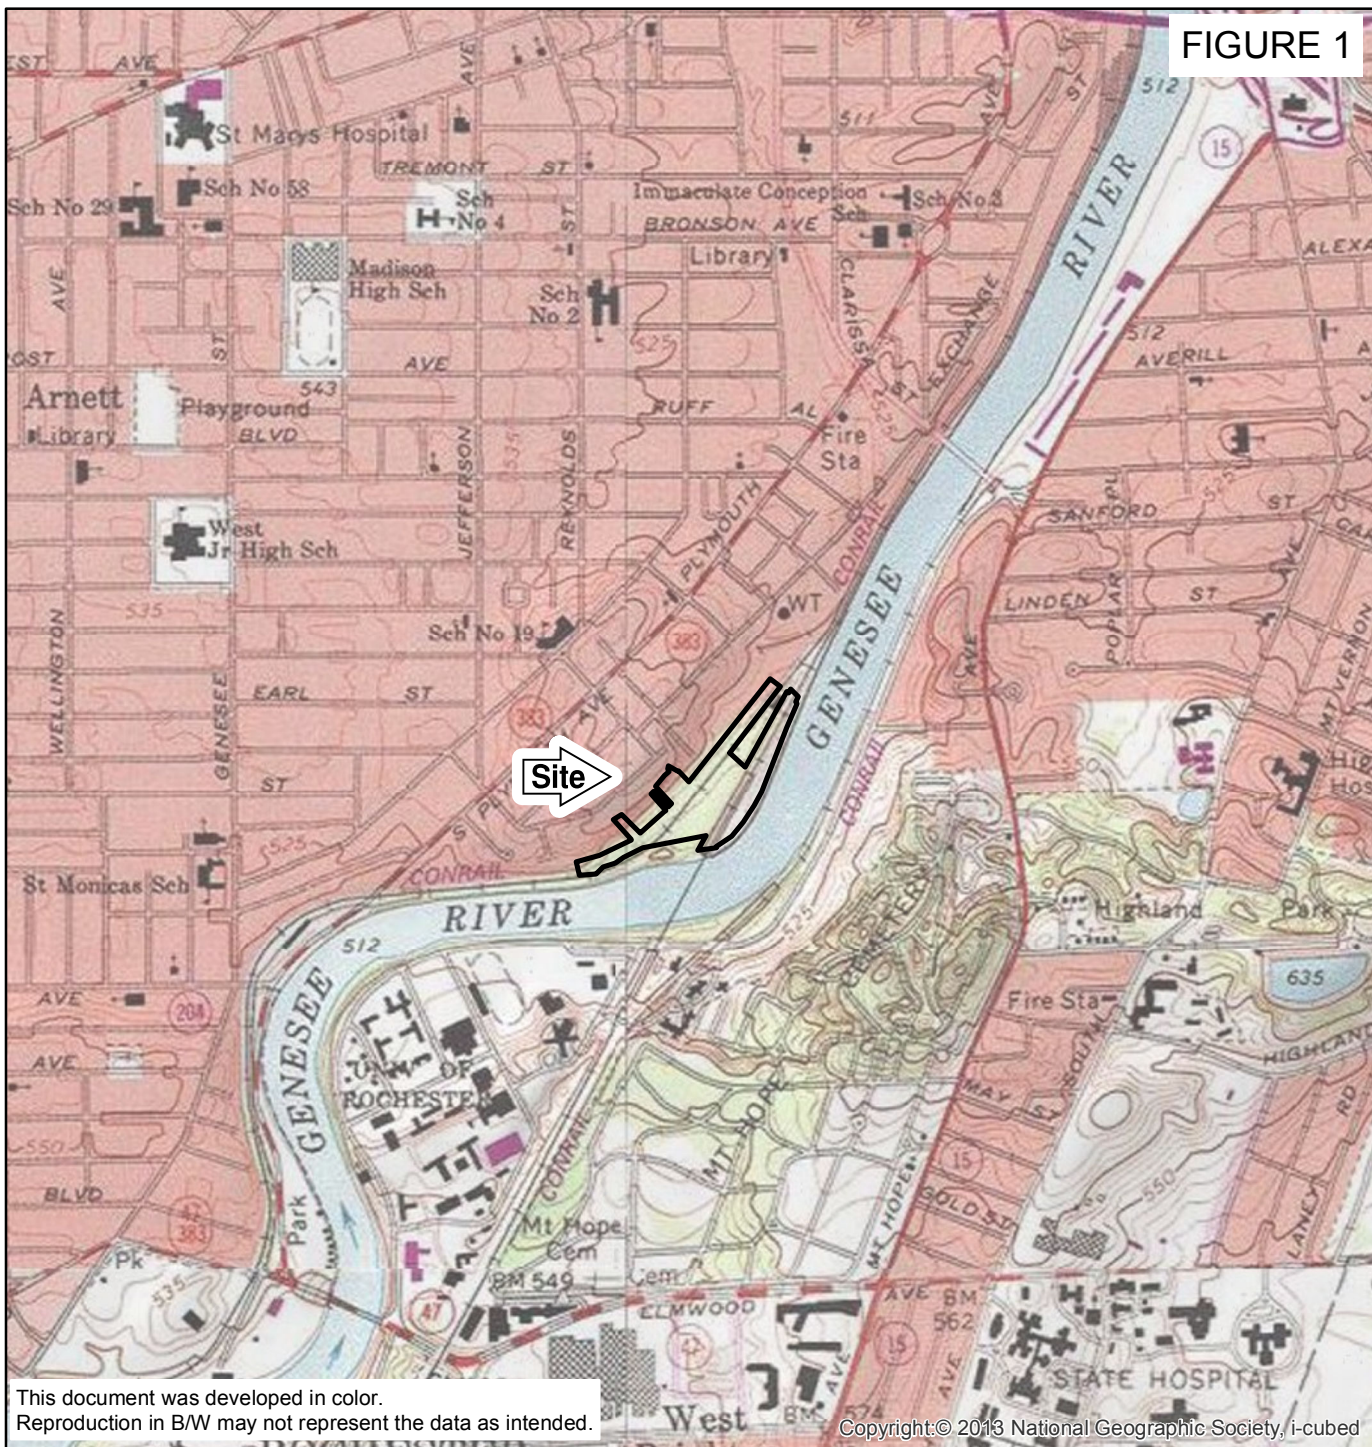

10.6 DAILY LOG CONTENTS

The Project Manager and the SSHC will establish a documentation system that will record, at a minimum, the following information:

- OBG personnel and other personnel conducting the site activities, their arrival and departure times, and their destination at the investigation areas;
- Incidents and unusual activities that occur on the site such as, but not limited to, accidents, breaches of security, injuries, equipment failures and weather related problems;
- Changes to the RI Work Plan and the HASP; and
- Daily Information such as:
 - » Pre-Task Planner
 - » Work accomplished and the current site status
 - » Air monitoring results.

HAZARD	HAZARD CONTROLS (check all that apply and comment as required)
<input type="checkbox"/> Railroad accidents	<p>be posted to indicate construction activities.</p> <input checked="" type="checkbox"/> Pedestrian traffic will be safely routed around or under overhead work. Cone and/or signs will be posted to indicate construction activities. <input type="checkbox"/> Railroad owner notified for permission to work on the railroad right-of-way. <input type="checkbox"/> Railroad flagger is required for work in the right-of-way. <input type="checkbox"/> Equipment, materials, and personnel may not be closer than 15' to the nearest railroad rail if the railroad flagger or the flagger's signal is not visible. <input type="checkbox"/> Derailer(s)/bumper(s) will be installed on railroad tracks to isolate the work area. <p>ROADWAY, RAILROAD, & SIDEWALK COMMENTS: Encountering pedestrians on/nearby the walking trails are a possibility. Signage and/or cones will be used to detour pedestrians if drilling is to be performed in/near trail way. Cones are required around drill rig to warn pedestrians if in an active walking area. Any persons loitering will be asked to leave the Site. If loitering continues or suspicious activity takes place- call 911 to have disturbance removed.</p>

BIOLOGICAL HAZARDS

<p>Infection, Lyme Disease, West Nile Virus, Eastern Equine Encephalitis (EEE), Severe Rash, Allergic Reaction, Venom effects</p> <input checked="" type="checkbox"/> Ticks <input checked="" type="checkbox"/> Mosquitoes (EEE, WNV, etc) <input type="checkbox"/> Venomous Snakes <input type="checkbox"/> Venomous Spiders <input checked="" type="checkbox"/> Poison Ivy, Oak, or Sumac <input checked="" type="checkbox"/> Bees & Wasps <input type="checkbox"/> Fire Ants <input type="checkbox"/> Other (identify below): <p><input type="checkbox"/> NA</p>	<input checked="" type="checkbox"/> Use DEET (25%-98%) repellent on skin for protection against mosquitoes, ticks, and similar insects. Use higher concentrations for heavily infested areas. <input checked="" type="checkbox"/> Use Permethrin repellent on clothing in areas heavily infested with ticks, chiggers, etc. <input type="checkbox"/> Persons working in tick-infested overgrown areas instructed to wear spun-poly or Tyvek coveralls [required for all persons in ESR and working in the NE region plus NJ, & PA.] <input type="checkbox"/> Persons returning from work in tick-infested areas instructed to perform periodic field checks for ticks and a thorough tick inspection as soon as they get home. <input type="checkbox"/> Employees (only) instructed to call WorkCare for embedded ticks from fieldwork. <input type="checkbox"/> All site personnel will be instructed on how to identify poison ivy, sumac, and oak . (O'Brien & Gere Field Identification Guide or equiv. has been posted? <input type="checkbox"/> YES <input type="checkbox"/> NO) <input type="checkbox"/> Poison ivy barrier creams (e.g., Ivy Block) will be used on exposed skin prior to the workday. <input checked="" type="checkbox"/> Poison ivy neutralizing wipes or rubbing alcohol will be used on hands and exposed skin following work activities or incidents where contact with poison ivy/oak/sumac is suspected. <input checked="" type="checkbox"/> Protective coveralls (such as Tyvek™) will be used to prevent contact with ticks or poison ivy. <input type="checkbox"/> All site personnel will be instructed on how to identify venomous snakes indigenous to the area. List venomous snakes of concern in the "Comments" section below. (O'Brien & Gere Field Identification Guide or equiv. has been posted? <input type="checkbox"/> YES <input type="checkbox"/> NO) <input type="checkbox"/> All field personnel with a potential to encounter venomous snakes will wear: <input type="checkbox"/> Snake Chaps AND/OR <input type="checkbox"/> High Leather Safety Boots (NOT ankle-high boots/shoes) <input type="checkbox"/> All site personnel will be instructed on how to identify venomous spiders indigenous to the area. List venomous spiders of concern in the "Comments" section below. (O'Brien & Gere Field Identification Guide or equiv. has been posted? <input type="checkbox"/> YES <input type="checkbox"/> NO) <input checked="" type="checkbox"/> Site personnel with known allergies to bee/wasp stings, fire ant bites, or other insect bites carry an "EpiPen" or equivalent medication prescribed for treating allergic reaction. <p>BIOLOGICAL HAZARDS COMMENTS: Use of DEET or Permethrin will be voluntary and based on need. Site Safety Coordinator will be notified by personnel with allergies. <u>Deer Ticks:</u> Early summer in wooded areas is prominent for ticks. All employees must wear tick-repellent clothing and chemical repellent during on-site work. Work in tick infested areas requires DEET (>20%) on skin around the ankles, cuffs, neck, etc. and permethrin on outer clothing.</p>
--	---

HAZARD	HAZARD CONTROLS (check all that apply and comment as required)
	<div data-bbox="544 199 1055 577" data-label="Image"> </div> <ol style="list-style-type: none"> 1. Avoid/ minimize time spent in tall grassy and woodland areas with rank vegetation and leaf litter. If possible, keep tall grassy weeds trimmed away from regular work sites and stay on trails or roads to avoid brushing the tips of tall grass. 2. Wear long sleeved shirts, long pants tucked into socks, elastic gaiters wrapped around where pants and boots meet, boots, and a hard hat or hood. 3. Applying insect repellent containing greater than or equal to 20% DEET to skin will help repel ticks & mosquitoes. The most effective tick repellent is a permethrin-based spray (such as Repel, Permanone, or similar preparation) applied to outer clothing & allow to dry overnight. Do not apply Permethrin spray to skin. Use both in combination in heavily infested areas. 4. Check and shake clothing before entering a vehicle or building. Also check your hairline. If ticks are encountered, remove them with some sort of sticky tape or tick remover. 5. Shower as soon as possible when leaving the field & check hairlines, arm pits, crotch, ankles & between toes for ticks. 6. If a tick is attached to your skin, grasp tick close to skin with proper tick removal tools. Pull tick straight out, use antiseptic on skin, disinfect tweezers, & wash hands thoroughly. 7. Do not grasp, squeeze or twist body of the tick. Do NOT use a match or coat the tick with nail polish or paint or other material in an attempt to remove it. 8. Always see a physician for possible diagnosis, testing & treatment as soon as possible if you suspect the tick as been embedded >48 hours. 9. Improper tick removal increase chances of infection. 10. Report embedded ticks. (Don't worry...they are not treated as an "incident" unless subsequent infection or disease occurs.) <p><u>Bee Sting Treatment:</u></p> <ol style="list-style-type: none"> 1. Remove the stinger. Don't use tweezers, use a dull straight edge. 2. Use a cool compress or ice. 3. Minimize allergic reaction by using Benadryl, see a Doctor if severe allergic reaction occurs. <p><u>Poison Ivy:</u></p> <div data-bbox="544 1522 852 1827" data-label="Image"> </div> <p>Avoid contact with poison ivy plants and apply barrier cream (e.g., Ivy Block) prior to work if needed. Clean exposed skin immediately with IPA or appropriate ivy wipes if contact has been made. Use cold water rinse. Warm soapy water should not be used to wash the suspect contact area as soap spreads the toxin.</p>

HAZARD	HAZARD CONTROLS (check all that apply and comment as required)
	<p>ENVIRONMENTAL & CHEMICAL HAZARD COMMENTS:</p> <p>To minimize potential exposure to COCs, disposable gloves will be worn.</p> <p>Wells will be allowed to vent prior to initiating testing activities to minimize potential exposure to COCs that may have built up in the air inside the well.</p>
<p>OTHER HAZARDS & CONTROLS not addressed in other sections of this JSA</p>	
<p><input type="checkbox"/> NA</p>	<p><input checked="" type="checkbox"/> Heat Stress</p> <p><input checked="" type="checkbox"/> Cold Stress</p> <p><input checked="" type="checkbox"/> Asbestos</p> <p><input checked="" type="checkbox"/> Site workers will be trained to recognize the symptoms of heat/cold stress.</p> <p><input checked="" type="checkbox"/> Work/rest regimens will be employed by as necessary so that personnel do not suffer adverse effects from heat/cold stress.</p> <p>ASBESTOS</p> <ul style="list-style-type: none"> Asbestos containing material (ACM) was identified in subsurface fill/debris encountered on the adjoining off-Site parcel identified as 15 Flint Street. As such, there is the potential that ACM could be encountered on the Site. A New York State-certified ACM inspector will respond to the Site if suspect ACM is observed during subsurface activities including soil boring advancement and test pit excavation. If suspect ACM is identified, work shall be halted in the vicinity and appropriate measures will be discussed with the City DEQ Project Manager and NYSDEC Project Manager. A scope of work addendum will be prepared and implemented in accordance with New York State Department of Labor (NYS DOL) regulations to address the ACM. The following will apply for purposes of Health and Safety related to removal of the debris identified to contain suspect ACM and ACM: A certified asbestos abatement contractor will be required to excavate the debris areas identified to contain suspect ACM and ACM. An exclusion zone specific to the asbestos abatement work (i.e., the project Work Area, as defined and regulated under 12 NYCRR Part 56) will be established during the excavation of debris that contains suspect ACM and during asbestos abatement. Per 12 NYCRR Part 56, the asbestos Work Area is a regulated work area and shall be accessed by certified personnel only. OBG personnel shall not enter this Exclusion Zone during excavation and abatement work. The Work Area will be labeled and monitored in accordance with 12 NYCRR Part 56 by the Contractor and/or the Project Monitor.

EMERGENCY RESPONSE

(911 Service is Available Yes No Cell Phone Required Yes No)

Alternate Emergency Number (if not "911"): N/A

Site Address: Various: 1, 13, 31, 69, and 75 Cottage Street; 100 Riverview Place; 102 Violetta Street; and 1320 S. Plymouth Avenue

Muster Point in case of site evacuation: TBD at Start of Field Activities

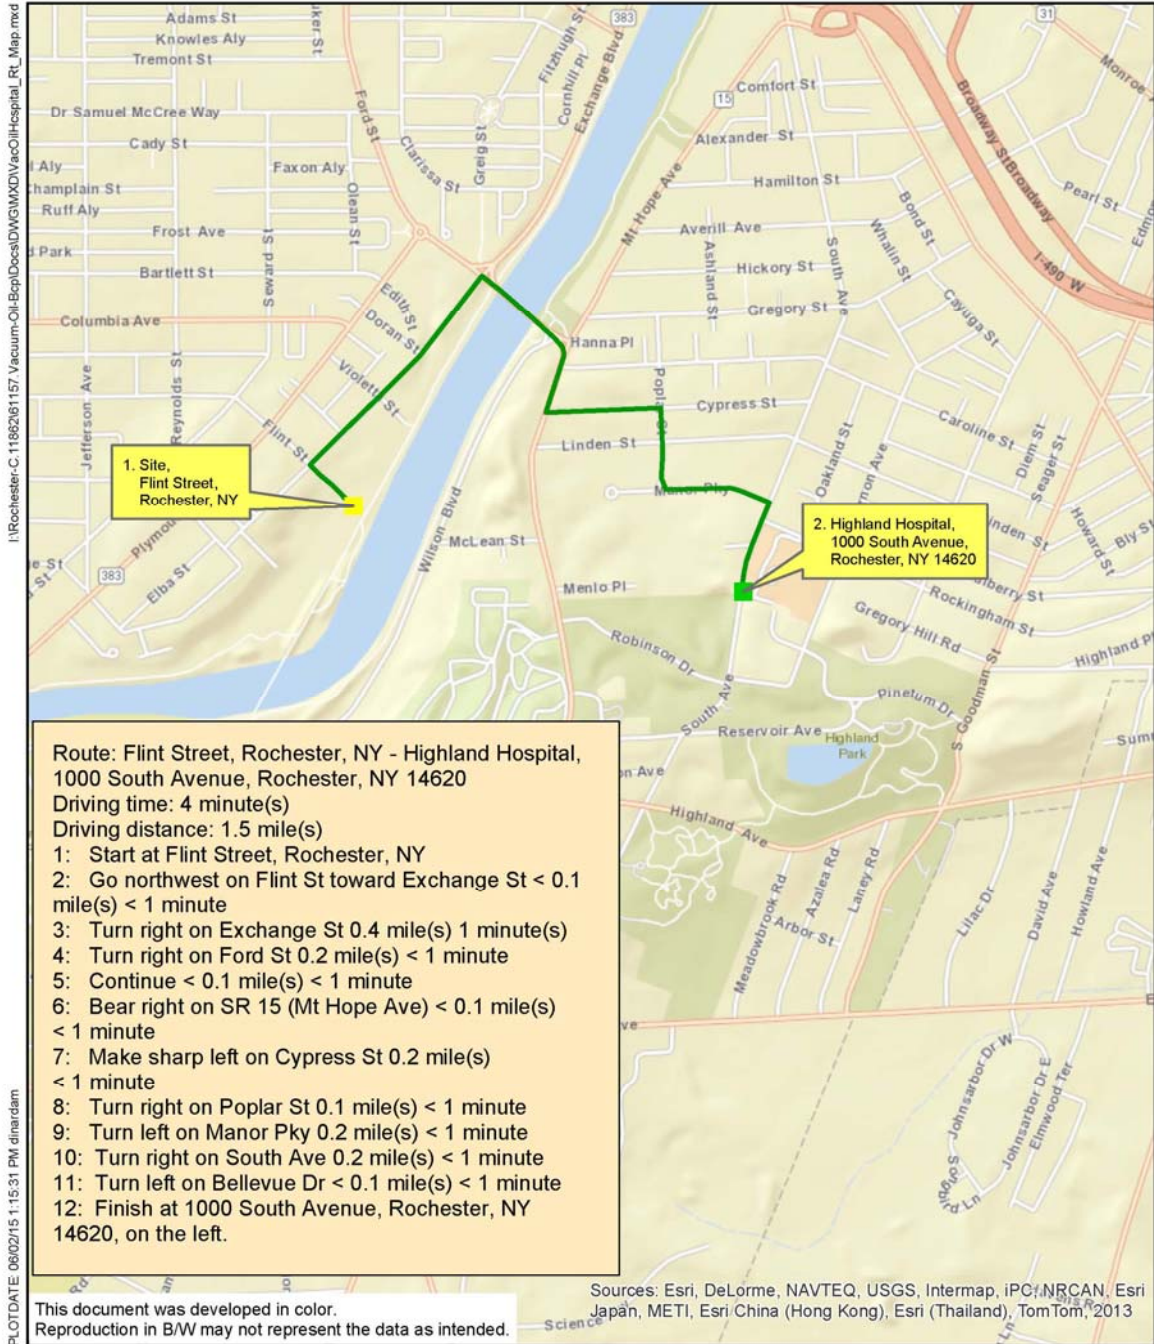

Emergency Medical Treatment - Hospital Name:	Highland Hospital	Number:	585-341-6880
Hospital Address:	1000 South Avenue, Rochester, NY		
Non-Emergency Med. Treatment - Clinic Name:	Finger Lakes Occupational Health	Number:	585-244-4771
Occupational Clinic Address:	2180 Clinton Ave S, Rochester, NY		
Minor Injury Support for OBG Employees:	WorkCare Incident Intervention	Number:	888-449-7787
Fire Department Name	Rochester Fire Department	Number:	585-428-7485
Spill Response:	NYS Emergency Response Spill Hot Line	Number:	800-457-7362 585-226-5433
Client Representative Name:	Joseph Biodolillo City of Rochester	Office Number:	585-428-6649

EMERGENCY RESPONSE COMMENTS:

1. NOTIFICATIONS - Upon occurrence of any injury, fire, explosion, major spill (beyond incidental), property damage >\$1,000, or near-miss that could have resulted in a fatality or disabling injury, **IMMEDIATELY NOTIFY** the O'Brien & Gere Project Manager, O'Brien & Gere Manager of Corporate H&S, and the Client Representative.
2. WRITTEN REPORT - Complete an *Incident Report* within **24 hours** and submit to the O'Brien & Gere Manager of Corporate H&S for review. Report may be submitted as a "draft" or "preliminary" and updated as additional information is identified.
3. INJURY RESPONSE
 - First aid injuries will be handled on site with FA-trained personnel. First aid and CPR supplies are located: Field Vehicle.
 - **All O'Brien & Gere employees will call WorkCare for minor injuries** that include any strains, cuts for which an employee is not confident that a band aid is sufficient, tick/insect bites for which the employee is concerned about infection or Lyme, any other work-related injury for which the employee would like to talk to a WorkCare medical professional regarding proper treatment or follow-up.
 - **WorkCare posters must be posted at each job site with a field office or trailer.**
 - Minor (not life threatening) injuries that require medical attention will be treated at the "Non-Emergency Med Treatment" clinic identified above **unless an alternate clinic is recommended by WorkCare**. If no clinic is available or identified, then default to the "Emergency Medical Treatment" facility.
 - Life Threatening injuries are an emergency and require implementing emergency response (911 or alternate).
4. FIRE or EXPLOSION
 - Incipient stage (trash can size) fires may be handled by site personnel using fire extinguishers or hoses.
 - Larger fires will require that affected personnel are evacuation to the identified muster point and implementing emergency response (911 or alternate).
5. SPILL RESPONSE
 - Major spills that exceed the available supplies and resources to safely control and cleanup will require contacting an off-site spill responder indicated above for "Spill Response" and in accordance with existing site spill response plans. If a specific spill responder is not identified, a large spill will require implementing emergency response (911 or alternate).
 - Review available spill control and prevention plans that may be applicable to the work area. Ensure project personnel are familiar with plan requirements.
 - Minor or incident spills will be cleaned up by site personnel using supplies that are located: _____.
 - The site owner will make notifications for reportable spills unless O'Brien & Gere is authorized to make those notifications.
6. POSTING - Emergency numbers and Hospital Route Map are posted: _____.

DAILY EXCAVATION CHECKLIST

Client:	Today's Date:		
Project Name:	Approx. Temp		
Project Location:	Approx. Wind Dir		
Job No.:	SSHC:		
Excavation Depth & Width:	D:	W:	Soil Class:
Protective System Used:			
Activities in Excavation:			
Competent Person:			

CONFINED SPACE HAZARD - Excavation > 4' deep? Yes No *If Yes, - Evaluate if the excavation is a permit-required confined space or can be downgraded to a Non-Permit Space*

CAUTION REGARDING DEEP EXCAVATIONS: Any excavation over 5 feet must be sloped or shored. Excavations >20 feet require review by a Professional Engineer. Any items marked NO on this form MUST be corrected prior to any employees entering the excavation. Review Excavation from the Corporate Health & Safety Manual for guidance.

Y	N	N/A	GENERAL
			Employees in, or near, excavations are protected from cave-ins or from being struck by loose rock/soil
			Spoils, materials, and equipment set back at least 2 feet from the edge of the excavation
			Engineering designs for sheeting and/or manufacturers data on trench box capabilities on site
			Adequate signs posted, and barricades provided
			Training (i.e, Toolbox meeting) conducted with employees prior to employees entering excavation
			Proper sloping, shoring, and/or distance controls are in place to prevent damage to footings, foundations, sidewalks, roadways, and similar structures from cave-ins or excavation equipment.

Y	N	N/A	UTILITIES
			Utility company contacted and given 24 hrs notice and/or utilities already located and marked
			Overhead lines located, noted, and reviewed with operator
			Utility location reviewed with operator, and precautions taken to ensure contact does not occur
			Utilities crossing the excavation supported, and protected from falling materials
			Underground installations protected, supported or removed when excavation is open

Y	N	N/A	WET CONDITIONS
			Precautions taken to protect employees from water accumulation (i.e., continuous dewatering)
			Surface water or runoff diverted/controlled to prevent accumulation in the excavation
			Inspection made after every rainstorm or other hazard-increasing occurrence

Y	N	N/A	HAZARDOUS ATMOSPHERE
			Air in the excavation tested for oxygen deficiency, combustibles, or other contaminants
			Ventilation used in atmospheres that are O ₂ rich or deficient and/or contains hazardous substances
			Ventilation provided to keep LEL below 10%
			Emergency equipment available where hazardous atmospheres could or do exist
			Safety harness and lifeline used
			Supplied Air necessary (if Yes, contact CHS prior to entry)

Y	N	N/A	ENTRY & EXIT
			Exit (i.e., ladder, sloped wall) no further than 25 feet from ANY employee
			Ladders secured, and extended 3 feet above the edge of the trench
			Wood ramps constructed of materials of uniform thickness, cleated together on the bottom.
			Employees protected from cave-ins when entering or exiting the excavation

**Keep 1 copy of EACH Daily Checklist on site for the project duration
Separate forms are required for each excavation.**

Note: The information presented in this Citizen Participation Plan was current as of the date of its approval by the New York State Department of Environmental Conservation. Portions of this Citizen Participation Plan may be revised during the site’s investigation and cleanup process.

Applicant: **City of Rochester (Applicant)**

Site Name: **Portion of Former Vacuum Oil Refinery (Site)**

Site Address: **1, 13, 31, 69, and 75 Cottage Street; 100 Riverview Place; 102 Violetta Street; and 1320 S. Plymouth Avenue**

Site County: **Monroe**

Site Number: **C828190**

1. What is New York’s Brownfield Cleanup Program?

New York’s Brownfield Cleanup Program (BCP) works with private developers to encourage the voluntary cleanup of contaminated properties known as “brownfields” so that they can be reused and developed. These uses include recreation, housing, and business.

A *brownfield* is any real property that is difficult to reuse or redevelop because of the presence or potential presence of contamination. A brownfield typically is a former industrial or commercial property where operations may have resulted in environmental contamination. A brownfield can pose environmental, legal, and financial burdens on a community. If a brownfield is not addressed, it can reduce property values in the area and affect economic development of nearby properties.

The BCP is administered by the New York State Department of Environmental Conservation (NYSDEC) which oversees Applicants that conduct brownfield site investigation and cleanup activities. An Applicant is a person who has requested to participate in the BCP and has been accepted by NYSDEC. The BCP contains investigation and cleanup requirements, ensuring that cleanups protect public health and the environment. When NYSDEC certifies that these requirements have been met, the property can be reused or redeveloped for the intended use.

For more information about the BCP, go online at: <http://www.dec.ny.gov/chemical/8450.html> .

2. Citizen Participation Activities

Why NYSDEC Involves the Public and Why It Is Important

NYSDEC involves the public to improve the process of investigating and cleaning up contaminated sites, and to enable citizens to participate more fully in decisions that affect their health, environment, and social well being. NYSDEC provides opportunities for citizen involvement and encourages early two-way communication with citizens before decision makers form or adopt final positions.

Involving citizens affected and interest in site investigation and cleanup programs is important for many reasons. These include:

- Promoting the development of timely, effective site investigation and cleanup programs that protect public health and the environment
- Improving public access to, and understanding of, issues and information related to a particular site and that site's investigation and cleanup process
- Providing citizens with early and continuing opportunities to participate in NYSDEC's site investigation and cleanup process
- Ensuring that NYSDEC makes site investigation and cleanup decisions that benefit from input that reflects the interests and perspectives found within the affected community
- Encouraging dialogue to promote the exchange of information among the affected/interested public, State agencies, and other interested parties that strengthens trust among the parties, increases understanding of site and community issues and concerns, and improves decision making.

This Citizen Participation (CP) Plan provides information about how NYSDEC will inform and involve the public during the investigation and cleanup of the site identified above. The public information and involvement program will be carried out with assistance, as appropriate, from the Applicant.

Project Contacts

Appendix A identifies NYSDEC project contact(s) to whom the public should address questions or request information about the site's investigation and cleanup program. The public's suggestions about this CP Plan and the CP program for the site are always welcome. Interested people are encouraged to share their ideas and suggestions with the project contacts at any time.

Locations of Reports and Information

The locations of the reports and information related to the site's investigation and cleanup program also are identified in Appendix A. These locations provide convenient access to important project documents for public review and comment. Some documents may be placed on the NYSDEC web site. If this occurs, NYSDEC will inform the public in fact sheets distributed about the site and by other means, as appropriate.

Site Contact List

Appendix B contains the site contact list. This list has been developed to keep the community informed about, and involved in, the site's investigation and cleanup process. The site contact list will be used periodically to distribute fact sheets that provide updates about the status of the

project. These will include notifications of upcoming activities at the site (such as fieldwork), as well as availability of project documents and announcements about public comment periods. The site contact list includes, at a minimum:

- chief executive officer and planning board chairperson of each county, city, town, and village in which the site is located;
- residents, owners, and occupants of the site and properties adjacent to the site;
- the public water supplier which services the area in which the site is located;
- any person who has requested to be placed on the site contact list;
- the administrator of any school or day care facility located on or near the site for purposes of posting and/or dissemination of information at the facility;
- location(s) of reports and information.

The site contact list will be reviewed periodically and updated as appropriate. Individuals and organizations will be added to the site contact list upon request. Such requests should be submitted to the NYSDEC project contact(s) identified in Appendix A. Other additions to the site contact list may be made at the discretion of the NYSDEC project manager, in consultation with other NYSDEC staff as appropriate.

CP Activities

The table at the end of this section identifies the CP activities, at a minimum, that have been and will be conducted during the site's investigation and cleanup program. The flowchart in Appendix D shows how these CP activities integrate with the site investigation and cleanup process. The public is informed about these CP activities through fact sheets and notices distributed at significant points during the program. Elements of the investigation and cleanup process that match up with the CP activities are explained briefly in Section 5.

- **Notices and fact sheets** help the interested and affected public to understand contamination issues related to a site, and the nature and progress of efforts to investigate and clean up a site.
- **Public forums, comment periods, and contact with project managers** provide opportunities for the public to contribute information, opinions and perspectives that have potential to influence decisions about a site's investigation and cleanup.

The public is encouraged to contact project staff at any time during the site's investigation and cleanup process with questions, comments, or requests for information.

This CP Plan may be revised due to changes in major issues of public concern identified in Section 3 or in the nature and scope of investigation and cleanup activities. Modifications may include additions to the site contact list and changes in planned citizen participation activities.

Technical Assistance Grant

NYSDEC must determine if the site poses a significant threat to public health or the environment. This determination generally is made using information developed during the investigation of the site, as described in Section 5.

If the site is determined to be a significant threat, a qualifying community group may apply for a Technical Assistance Grant (TAG). The purpose of a TAG is to provide funds to the qualifying group to obtain independent technical assistance. This assistance helps the TAG recipient to interpret and understand existing environmental information about the nature and extent of contamination related to the site and the development/implementation of a remedy.

An eligible community group must certify that its membership represents the interests of the community affected by the site, and that its members' health, economic well-being or enjoyment of the environment may be affected by a release or threatened release of contamination at the site.

For more information about TAGs, go online at <http://www.dec.ny.gov/regulations/2590.html>

Note: The table identifying the citizen participation activities related to the site's investigation and cleanup program follows on the next page:

Citizen Participation Requirements (Activities)	Timing of CP Activity(ies)
Application Process:	
<ul style="list-style-type: none"> • Prepare site contact list • Establish document repositories 	At time of preparation of application to participate in the BCP.
<ul style="list-style-type: none"> • Publish notice in Environmental Notice Bulletin (ENB) announcing receipt of application and 30-day public comment period • Publish above ENB content in local newspaper • Mail above ENB content to site contact list • Conduct 30-day public comment period 	When NYSDEC determines that BCP application is complete. The 30-day public comment period begins on date of publication of notice in ENB. End date of public comment period is as stated in ENB notice. Therefore, ENB notice, newspaper notice, and notice to the site contact list should be provided to the public at the same time.
After Execution of Brownfield Site Cleanup Agreement:	
<ul style="list-style-type: none"> • Prepare Citizen Participation (CP) Plan 	Before start of Remedial Investigation
Before NYSDEC Approves Remedial Investigation (RI) Work Plan:	
<ul style="list-style-type: none"> • Distribute fact sheet to site contact list about proposed RI activities and announcing 30-day public comment period about draft RI Work Plan • Conduct 30-day public comment period 	Before NYSDEC approves RI Work Plan. If RI Work Plan is submitted with application, public comment periods will be combined and public notice will include fact sheet. Thirty-day public comment period begins/ends as per dates identified in fact sheet.
After Applicant Completes Remedial Investigation:	
<ul style="list-style-type: none"> • Distribute fact sheet to site contact list that describes RI results 	Before NYSDEC approves RI Report
Before NYSDEC Approves Remedial Work Plan (RWP):	
<ul style="list-style-type: none"> • Distribute fact sheet to site contact list about proposed RWP and announcing 45-day public comment period • Public meeting by NYSDEC about proposed RWP (if requested by affected community or at discretion of NYSDEC project manager) • Conduct 45-day public comment period 	Before NYSDEC approves RWP. Forty-five day public comment period begins/ends as per dates identified in fact sheet. Public meeting would be held within the 45-day public comment period.
Before Applicant Starts Cleanup Action:	
<ul style="list-style-type: none"> • Distribute fact sheet to site contact list that describes upcoming cleanup action 	Before the start of cleanup action.
After Applicant Completes Cleanup Action:	
<ul style="list-style-type: none"> • Distribute fact sheet to site contact list that announces that cleanup action has been completed and that summarizes the Final Engineering Report • Distribute fact sheet to site contact list announcing issuance of Certificate of Completion (COC) 	At the time NYSDEC approves Final Engineering Report. These two fact sheets are combined if possible if there is not a delay in issuing the COC.

3. Major Issues of Public Concern

This section of the CP Plan identifies major issues of public concern that relate to the site. Additional major issues of public concern may be identified during the course of the site's investigation and cleanup process.

There are potential contamination issues of public concern at the site based on the results of the past environmental tests. Section 4 below provides information about the site contaminants. The site is not near public water supply or private water wells, but it is adjacent to the Genesee River.

Contaminants can become airborne during investigation and cleanup activities. Testing will be performed during these activities to measure the level of contaminants in the air. Action will be taken if the levels get too high.

4. Site Information

Appendix C contains a map identifying the location of the site.

Site Description

- **Location** - 1, 13, 31, 69, and 75 Cottage Street; 100 Riverview Place; 102 Violetta Street, and 1320 S. Plymouth Avenue; City of Rochester; Monroe County, New York
- **Setting** – Vacant Commercial Land – Use Code 340 (1, 13 Cottage Street, 100 Riverview Place, 102 Violetta Street, and 1320 S. Plymouth Avenue); Vacant Residential Land – Use Code 311 (31, 69, and 75 Cottage Street)
- **Zoning** – Residential R1
- **Site size** - Approximately 15.4 acres
- **Adjacent properties** - Mix of residential, commercial, and light industrial properties. Portions of adjacent properties are vacant. The Genesee River is present to the east of the site. The Flint Street Right-of-Way is also present along the northern boundary of the site.

History of Site Use, Investigation, and Cleanup

Site

Most of the site, about 15 acres, was either part of the former Vacuum Oil Company refinery or was part of the associated support operations such as railroads. At one time, the refinery and railroads covered about 30 to 40 acres (estimates vary) and operated from about 1866 to 1930. Three properties (31, 69, and 75 Cottage Street) are next to the former refinery, but were not part of it. Over time, the Vacuum Oil Company became ExxonMobil Corporation. The site is currently vacant and includes wooded, grass-covered, and paved trail areas.

The refinery distilled crude petroleum to produce different petroleum products. Site operations included a barrel preparation and storage area, a canal, and railroads. Most of the structures were

demolished in place when the refinery closed. Some remnants of former structures and other scattered debris remain. This includes, former railroad bed foundation walls, former building slabs and foundation walls, concrete rubble, scattered bricks, fire hydrants, crushed metal drums/tanks, metal piping, tires, vehicle parts, ash/black foundry sand. There have been no industrial or commercial operations at the site since the refinery closed.

Past test results suggest that the soil and groundwater are contaminated with a variety of chemicals. These chemicals include: volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), and metals.

The site is also part of the much larger City Vacuum Oil - South Genesee River Corridor Brownfield Opportunity Area (BOA). The BOA program provides resources to plan, design, and begin implementing targeted investment projects which support and enhance on-going revitalization efforts in the study area. The Vacuum Oil BOA project is a community-based planning effort that seeks to integrate ideas generated from residents, business owners, and other stakeholders into the actual development of plan recommendations. Involvement and participation by the public is critical to ensuring the planning processes are successful and the final plans achieve the community's vision. The BOA Master Plans to date include mixed use development, waterfront and open space improvements, flex space and incubator/workforce training, and commercial and housing redevelopment. The City submitted and was awarded funding in 2015 to proceed with implementation of the final step in the BOA program, which will include refinements to the Master Plan based on findings from additional BOA studies. While the BOA program is run by the NYS Department of State and the BCP is run by the NYS Department of Environmental Conservation, the two programs work together to help revitalize communities.

5 Flint Street and 15 Flint Street (Adjoining off Site Parcels)

A separate BCP project is being performed by a private developer for the 5 Flint Street and 15 Flint Street parcels (NYSDEC Site No. C828162). These two properties were also part of the Vacuum Oil refinery and cover about 7 acres. Further information regarding the 5 & 15 Flint Street BCP can be found at the Phillis Wheatley Community Library.

5. Investigation and Cleanup Process

Application

The Applicant has applied for and been accepted into New York's Brownfield Cleanup Program as a **Volunteer**. This means that the Applicant was not responsible for the disposal or discharge of the contaminants or whose ownership or operation of the site took place after the discharge or disposal of contaminants. The Volunteer must fully characterize the nature and extent of contamination onsite, and must conduct a "qualitative exposure assessment," a process that characterizes the actual or potential exposures of people, fish and wildlife to contaminants on the site and to contamination that has migrated from the site.

The Applicant in its Application proposes that the site will be used for restricted purposes.

To achieve this goal, the Applicant will conduct investigation activities at the site with oversight provided by NYSDEC. The Brownfield Cleanup Agreement executed by NYSDEC and the Applicant sets forth the responsibilities of each party in conducting these activities at the site.

Investigation

The Applicant will conduct an investigation of the site officially called a “remedial investigation” (RI). This investigation will be performed with NYSDEC oversight. The Applicant must develop a remedial investigation workplan, which is subject to public comment.

The site investigation has several goals:

- 1) Define the nature and extent of contamination in soil, surface water, groundwater, and any other parts of the environment that may be affected;
- 2) Identify the source(s) of the contamination;
- 3) Assess the impact of the contamination on public health and the environment; and
- 4) Provide information to support the development of a proposed remedy to address the contamination or the determination that cleanup is not necessary.

When the investigation is complete, the Applicant will prepare and submit a report that summarizes the results. This report also will recommend whether cleanup action is needed to address site-related contamination. The investigation report is subject to review and approval by NYSDEC.

NYSDEC will use the information in the investigation report to determine if the site poses a significant threat to public health or the environment. If the site is a “significant threat,” it must be cleaned up using a remedy selected by NYSDEC from an analysis of alternatives prepared by the Applicant and approved by NYSDEC. If the site does not pose a significant threat, the Applicant may select the remedy from the approved analysis of alternatives.

Remedy Selection

When the investigation of the site has been determined to be complete, the project likely would proceed in one of two directions:

1. The Applicant may recommend in its investigation report that no action is necessary at the site. In this case, NYSDEC would make the investigation report available for public comment for 45 days. NYSDEC then would complete its review, make any necessary revisions, and, if appropriate, approve the investigation report. NYSDEC would then issue a “Certificate of Completion” (described below) to the Applicant.

or

2. The Applicant may recommend in its investigation report that action needs to be taken to address site contamination. After NYSDEC approves the investigation report, the Applicant may then develop a cleanup plan, officially called a “Remedial Work Plan”. The Remedial Work Plan describes the Applicant’s proposed remedy for addressing contamination related to the site.

When the Applicant submits a proposed Remedial Work Plan for approval, NYSDEC would announce the availability of the proposed plan for public review during a 45-day public comment period.

Cleanup Action

NYSDEC will consider public comments, and revise the draft cleanup plan if necessary, before approving the proposed remedy. The New York State Department of Health (NYSDOH) must concur with the proposed remedy. After approval, the proposed remedy becomes the selected remedy.

The Applicant may then design and perform the cleanup action to address the site contamination. NYSDEC and NYSDOH oversee the activities. When the Applicant completes cleanup activities, it will prepare a final engineering report that certifies that cleanup requirements have been achieved or will be achieved within a specific time frame. NYSDEC will review the report to be certain that the cleanup is protective of public health and the environment for the intended use of the site.

Certificate of Completion

When NYSDEC is satisfied that cleanup requirements have been achieved or will be achieved for the site, it will approve the final engineering report. NYSDEC then will issue a Certificate of Completion (COC) to the Applicant. The COC states that cleanup goals have been achieved, and relieves the Applicant from future liability for site-related contamination, subject to certain conditions. The Applicant would be eligible to redevelop the site after it receives a COC.

Site Management

Site management is the last phase of the site cleanup program. This phase begins when the COC is issued. Site management may be conducted by the Applicant under NYSDEC oversight, if contamination will remain in place. Site management incorporates any institutional and engineering controls required to ensure that the remedy implemented for the site remains protective of public health and the environment. All significant activities are detailed in a Site Management Plan.

An institutional control is a non-physical restriction on use of the site, such as a deed restriction that would prevent or restrict certain uses of the property. An institutional control may be used when the cleanup action leaves some contamination that makes the site suitable for some, but not all uses.

An engineering control is a physical barrier or method to manage contamination. Examples include: caps, covers, barriers, fences, and treatment of water supplies.

Site management also may include the operation and maintenance of a component of the remedy, such as a system that is pumping and treating groundwater. Site management continues until NYSDEC determines that it is no longer needed.

Appendix A - Project Contacts and Locations of Reports and Information

Project Contacts

For information about the site's investigation and cleanup program, the public may contact any of the following project staff:

New York State Department of Environmental Conservation (NYSDEC):

Mr. Frank Sowers
Project Manager
NYSDEC Region 8
Division of Environmental Remediation
6274 Avon-Lima Road,
Avon, NY 14414-9516
(585) 226-5357
Email: frank.sowers@dec.ny.gov

Ms. Linda Vera
Regional Citizen Participation Specialist
NYSDEC Region 8
6274 Avon-Lima Road,
Avon, NY 14414-9516
(585) 226-5324
Email: linda.vera@dec.ny.gov

New York State Department of Health (NYSDOH):

Ms. Bridgette K. Boyd
Public Health Specialist III
Bureau of Environmental Exposure Investigation
New York State Department of Health
Empire State Plaza, Corning Tower, Room 1787
Albany, NY 12237
Phone: (518) 402-7860
Fax: (518) 402-7859
Email: BEEI@health.ny.gov

Locations of Reports and Information

The facilities identified below are being used to provide the public with convenient access to important project documents:

City of Rochester
City Hall
30 Church Street, Room Room 300B,
Rochester, NY 14614
Attn: Mr. Joseph Biondolillo
Phone: (585) 428-6649

Phillis Wheatley Community Library
33 Dr. Samuel McCree Way
Rochester, NY 14608
Phone: (585) 428-8212

NYSDEC Region 8
6274 Avon-Lima Road (Routes 5 and 20)
Avon, NY 14414-9516
Attn: Linda Vera
Phone: (585) 226-5324
Hours: 8:30 a.m.-4:45 p.m. Monday through
Friday
(call for appointment)

Plymouth-Exchange (PLEX) Neighborhood
Association
Carlson Commons
70 Coretta Scott Crossing
Rochester, NY 14608
Hours: Tuesday, Wednesday, and Thursdays
Noon - 4pm (subject to change)
PLEX meetings: Second Tuesday of every
month at Carlson Commons.
Phone: (585) 328-6916
Email: info@pl-ex.org

SDG NARRATIVE

Job#: A08-7595,A08-7691,A08-7988Project#: NY2A8951.6SDG#: 7595Site Name: LaBella AssociatesGeneral Comments

The enclosed data may or may not have been reported utilizing data qualifiers (Q) as defined on the Data Comment Page.

Soil, sediment and sludge sample results are reported on "dry weight" basis unless otherwise noted in this data package.

According to 40CFR Part 136.3, pH, Chlorine Residual, Dissolved Oxygen, Sulfite, and Temperature analyses are to be performed immediately after aqueous sample collection. When these parameters are not indicated as field (e.g. pH-Field), they were not analyzed immediately, but as soon as possible after laboratory receipt.

Sample dilutions were performed as indicated on the attached Dilution Log. The rationale for dilution is specified by the 3-digit code and definition.

Sample Receipt Comments

A08-7595

Sample Cooler(s) were received at the following temperature(s); 2.0 °C
Limited volume. Please use sparingly.

A08-7691

Sample Cooler(s) were received at the following temperature(s); 2.0 °C
For sample 02, Please run analysis in the following order: Voas, Metals, PCB's, Semi's, and if volume remains Pests.

A08-7988

Sample Cooler(s) were received at the following temperature(s); 2.0 °C
For sample 04 please run voas, metals, Semi's, PCB's, and Pests last if volume remains.

GC/MS Volatile Data

The analytes Acetone and Methylene Chloride were detected in the water Method Blank VBLK44 (A8B1833004) at a level above the project established reporting limit. However, all aqueous, field generated, Quality Control samples were associated with soil samples. Therefore, all aqueous samples were analyzed as soils and evaluated using soil Quality Control Limits.

The results presented in this report relate only to the analytical testing and condition of the sample at receipt. This report pertains to only those samples actually tested. All pages of this report are integral parts of the analytical data. Therefore, this report should be reproduced only in its entirety.

The analyte Methylene Chloride was detected in the soil Method Blank VBLK44 (A8B1833002) at a level above the project established reporting limit. The associated samples had levels of Methylene Chloride at a similar concentration to that of the Method Blank value. All sample detections for this analyte may potentially be due to laboratory contamination and should be evaluated accordingly. All associated sample detections were qualified with a "B".

The spike recovery of the analyte 1,1-Dichloroethene in the water Matrix Spike Blank MSB42 (A8B1811003) exceeded quality control limits. However, all aqueous, field generated, Quality Control samples were associated with soil samples. Therefore, all aqueous samples were analyzed as soils and evaluated using soil Quality Control Limits.

The spike recovery of the analyte Chlorobenzene in the Matrix Spike Duplicate of sample SB-070/6-7.5 exceeded quality control limits. The Matrix Spike Blank recoveries were compliant, so no corrective action was performed.

Linear regression was used to calibrate all analytes that were greater than 15% RSD in the initial calibration standard curves A8I0000432-1 and A8I0000477-1.

For method 8260, all water samples were preserved to a pH less than 2.

The sample SB-052/6-8(ROC) was analyzed using medium level techniques due to sample matrix. This sample and associated quality control samples were extracted together in an extraction batch but were analyzed in different analytical batches. The Method Blank VBLK 070108 and the Matrix Spike Blank MSB 070108 were analyzed in an analytical batch on 07/04/2008 that was prior to the field sample analyzed on 07/08/2008.

As a result of low volume, the sample TRIP BLANK (A8769105) was analyzed from a vial containing headspace. The volatile organic results may be biased low and all positive detections and non-detections should be considered estimated.

The analytes Acetone, 2-Butanone and Methylene Chloride were detected in the TRIP BLANK (A8769105) at a level above the reporting limit. These analytes were not detected in any of the associated samples, with the exception of sample SB-050/6-8.

The analytes Acetone and Methylene Chloride were detected in the TRIP BLANK (A8798806) at a level above the project established reporting limit. These analytes were also detected in the associated Method Blank at a similar concentration. As a result these detects have been qualified with a "B" and should be evaluated accordingly.

The results presented in this report relate only to the analytical testing and condition of the sample at receipt. This report pertains to only those samples actually tested. All pages of this report are integral parts of the analytical data. Therefore, this report should be reproduced only in its entirety.

GC/MS Semivolatile Data

The surrogate recovery for 2,4,6-Tribromophenol was above the laboratory quality control limits for sample SB-53/0-1(ROC). The surrogate recoveries for 2,4,6-Tribromophenol and p-Terphenyl-d14 were above laboratory quality control limits for samples SB-018/4-6, SB-070/6-7.5, the Matrix Spike and the Matrix Spike Duplicate of sample SB-070/6-7.5. Based on the laboratory SOP, one surrogate in each fraction (base/neutral or acid fraction) may have a recovery outside of the control limit with no corrective action necessary.

Due to a laboratory oversight, 80 ngs of internal standard was inadvertently added to samples SB-53/0-1(ROC), SB-018/4-6, SB-070/6-7.5, the Matrix Spike and Matrix Spike Duplicate of sample SB-070/6-7.5.

The spike recoveries of several analytes in the Matrix Spike and in the Matrix Spike Duplicate of sample SB-070/6-7.5 exceeded quality control limits. The associated Matrix Spike Blank recoveries were compliant, so no corrective action was performed.

Due to an oversight prior to analysis, the initial calibration curve A8I0000516-1 had only a 4 point calibration for 2,4-Dinitrophenol. This was not discovered until data review. The Methylene Chloride had evaporated from the sample vials and the associated QC. They were brought back up to the volume marker with Methylene Chloride and reanalyzed under a compliant curve for this analyte. Several of the reanalyzed samples (SB-018/4-6 RI, SB-070/6-7.5 RI, SB-070/6-7.5 MS RI, SB-070/6-7.5 MSD RI, and SBLK109 RI) had low recoveries for the first two internal standards (1,4-Dichlorobenzene-d4 and Naphthalene-d8) which would make all compounds, surrogates and spike recoveries associated with them biased high. The Matrix spiked Blank SMSB109 RI had low recoveries for the first internal standard (1,4-Dichlorobenzene-d4) which would bias all compounds, spikes and surrogates associated with this internal standard high. Samples SB-018/4-6 RI and SB-070/6-7.5 RI had low recoveries for the third internal standard (Acenaphthene-d10) which would bias all compounds, spikes and surrogates associated with this internal standard high. The reanalysis of sample SB-53/0-1(ROC) RI had low surrogate recoveries for all surrogates. Both sets of data have been reported in this data package.

Linear regression was used to calibrate all analytes, with the exception of Hexachlorocyclopentadiene, 2,4-Dinitrophenol and Pentachlorophenol, that were greater than 15% RSD in the initial calibration standard curve A8I0000516-1. A quadratic equation was used to calibrate the analytes Hexachlorocyclopentadiene, 2,4-Dinitrophenol and Pentachlorophenol that was greater than 15% RSD in the initial calibration standard curve A8I0000516-1.

The results presented in this report relate only to the analytical testing and condition of the sample at receipt. This report pertains to only those samples actually tested. All pages of this report are integral parts of the analytical data. Therefore, this report should be reproduced only in its entirety.

A quadratic equation was used to calibrate all analytes, with the exception of 2-Fluorophenol, 4,6-Dinitro-2-methylphenol, 2,4,6-Tribromophenol and Pentachlorophenol, that were greater than 15% RSD in the initial calibration standard curve A8I0000469-1. Linear regression was used to calibrate the analytes 2-Fluorophenol, 4,6-Dinitro-2-methylphenol, 2,4,6-Tribromophenol and Pentachlorophenol that was greater than 15% RSD in the initial calibration standard curve A8I0000469-1.

Linear regression was used to calibrate all analytes that were greater than 15% RSD in the initial calibration standard curves A8I0000469-2 and A8I0000536-1.

Linear regression was used to calibrate all analytes, with the exception of Benzo(k)fluoranthene, that were greater than 15% RSD in the initial calibration standard curves A8I0000399-1 and A8I0000548-1. A quadratic equation was used to calibrate the analyte Benzo(k)fluoranthene that was greater than 15% RSD in the initial calibration standard curves A8I0000399-1 and A8I0000548-1.

Sample SB-036/7.5-8(ROC), 8270 soil, had an adjusted final volume during extraction due to extract matrix and viscosity.

The chromatographic peaks for Benzo(b)fluoranthene and Benzo(k)fluoranthene could not be resolved for samples SB-002/6-8, SB-51/0-1(ROC) and SB-050/0-1(ROC) due to the sample matrix. The final value is reported as Benzo(b)fluoranthene in this data package but should be considered an and/or value for both compounds.

GC Extractable Data

For method 8081, samples SB-036/7.5-8(ROC), SB-51/0-1(ROC), and SB-51/0-1(ROC)RE required dilution prior to analysis due to the heavy matrix present. The surrogate and spike recoveries are diluted out of all sample extracts with a dilution factor of 10X or greater.

For method 8081, the recoveries of surrogate Decachlorobiphenyl in samples SB-53/0-1(ROC) and SB-53/0-1(ROC)RE were outside of established quality control limits due to the sample matrix. The recovery of surrogate Tetrachloro-m-xylene is within quality control limits; no corrective action is required.

For methods 8081 and 8082, the response of the instrument is decreased due to the heavy matrix effects from the field samples, resulting in >15% difference in the continuing calibration verifications analyzed after these sample extracts. Subsequent continuing calibration verifications demonstrated compliance with routine quality control criteria, verifying the temporary nature of this effect.

For method 8082, all sample extracts and associated quality control required treatment with Copper prior to analysis due to the presence of elemental Sulfur.

The results presented in this report relate only to the analytical testing and condition of the sample at receipt. This report pertains to only those samples actually tested. All pages of this report are integral parts of the analytical data. Therefore, this report should be reproduced only in its entirety.

For method 8081, samples were re-extracted outside of holding time due to Method Blank contamination and low spike/surrogate recoveries in the Matrix Spike Blank A8B1833801. Both sets of data has been reported and the re-extracted samples are identified with an "RE" suffix on the laboratory ID.

Metals Data

The recovery of sample SB-002/6-8 Matrix Spike and Matrix Spike Duplicate exhibited results below the quality control limits for Antimony. Sample matrix is suspect. However, the LFB was acceptable.

The Serial Dilution of sample SB-002/6-8 exceeded the quality control limits for Copper, Lead and Zinc. However, the Post Spike was compliant for these elements. Therefore, no corrective action was necessary.

"I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this Sample Data package and in the electronic data deliverables has been authorized by the Laboratory Manager or his/her designee, as verified by the following signature."

Jason R. Kacalski

DATA QUALIFIER PAGE

These definitions are provided in the event the data in this report requires the use of one or more of the qualifiers. Not all qualifiers defined below are necessarily used in the accompanying data package.

ORGANIC DATA QUALIFIERS

- ND or U Indicates compound was analyzed for, but not detected.
- J Indicates an estimated value. This flag is used either when estimating a concentration for tentatively identified compounds where a 1:1 response is assumed, or when the data indicates the presence of a compound that meets the identification criteria but the result is less than the sample quantitation limit but greater than zero.
- C This flag applies to pesticide results where the identification has been confirmed by GC/MS.
- B This flag is used when the analyte is found in the associated blank, as well as in the sample.
- E This flag identifies compounds whose concentrations exceed the calibration range of the instrument for that specific analysis.
- D This flag identifies all compounds identified in an analysis at the secondary dilution factor.
- N Indicates presumptive evidence of a compound. This flag is used only for tentatively identified compounds, where the identification is based on the Mass Spectral library search. It is applied to all TIC results.
- P This flag is used for CLP methodology only. For Pesticide/Aroclor target analytes, when a difference for detected concentrations between the two GC columns is greater than 25%, the lower of the two values is reported on the data page and flagged with a "P".
- A This flag indicates that a TIC is a suspected aldol-condensation product.
- 1 Indicates coelution.
- * Indicates analysis is not within the quality control limits.

INORGANIC DATA QUALIFIERS

- ND or U Indicates element was analyzed for, but not detected. Report with the detection limit value.
- J or B Indicates a value greater than or equal to the instrument detection limit, but less than the quantitation limit.
- N Indicates spike sample recovery is not within the quality control limits.
- S Indicates value determined by the Method of Standard Addition.
- E Indicates a value estimated or not reported due to the presence of interferences.
- H Indicates analytical holding time exceedance. The value obtained should be considered an estimate.
- G Indicates a value greater than or equal to the project reporting limit but less than the laboratory quantitation limit
- * Indicates the spike or duplicate analysis is not within the quality control limits.
- + Indicates the correlation coefficient for the Method of Standard Addition is less than 0.995.

SDG NARRATIVE

Job#: A08-7595, A08-7691, A08-7988Project#: NY2A8951.6SDG#: 7595Site Name: LaBella AssociatesGeneral Comments

The enclosed data may or may not have been reported utilizing data qualifiers (Q) as defined on the Data Comment Page.

Soil, sediment and sludge sample results are reported on "dry weight" basis unless otherwise noted in this data package.

According to 40CFR Part 136.3, pH, Chlorine Residual, Dissolved Oxygen, Sulfite, and Temperature analyses are to be performed immediately after aqueous sample collection. When these parameters are not indicated as field (e.g. pH-Field), they were not analyzed immediately, but as soon as possible after laboratory receipt.

Sample dilutions were performed as indicated on the attached Dilution Log. The rationale for dilution is specified by the 3-digit code and definition.

Sample Receipt Comments

A08-7595

Sample Cooler(s) were received at the following temperature(s); 2.0 °C
Limited volume. Please use sparingly.

A08-7691

Sample Cooler(s) were received at the following temperature(s); 2.0 °C
For sample 02, Please run analysis in the following order: Voas, Metals, PCB's, Semi's, and if volume remains Pests.

A08-7988

Sample Cooler(s) were received at the following temperature(s); 2.0 °C
For sample 04 please run voas, metals, Semi's, PCB's, and Pests last if volume remains.

GC/MS Volatile Data

The analytes Acetone and Methylene Chloride were detected in the water Method Blank VBLK44 (A8B1833004) at a level above the project established reporting limit. However, all aqueous, field generated, Quality Control samples were associated with soil samples. Therefore, all aqueous samples were analyzed as soils and evaluated using soil Quality Control Limits.

The results presented in this report relate only to the analytical testing and condition of the sample at receipt. This report pertains to only those samples actually tested. All pages of this report are integral parts of the analytical data. Therefore, this report should be reproduced only in its entirety.

The analyte Methylene Chloride was detected in the soil Method Blank VBLK44 (A8B1833002) at a level above the project established reporting limit. The associated samples had levels of Methylene Chloride at a similar concentration to that of the Method Blank value. All sample detections for this analyte may potentially be due to laboratory contamination and should be evaluated accordingly. All associated sample detections were qualified with a "B".

The spike recovery of the analyte 1,1-Dichloroethene in the water Matrix Spike Blank MSB42 (A8B1811003) exceeded quality control limits. However, all aqueous, field generated, Quality Control samples were associated with soil samples. Therefore, all aqueous samples were analyzed as soils and evaluated using soil Quality Control Limits.

The spike recovery of the analyte Chlorobenzene in the Matrix Spike Duplicate of sample SB-070/6-7.5 exceeded quality control limits. The Matrix Spike Blank recoveries were compliant, so no corrective action was performed.

Linear regression was used to calibrate all analytes that were greater than 15% RSD in the initial calibration standard curves A8I0000432-1 and A8I0000477-1.

For method 8260, all water samples were preserved to a pH less than 2.

The sample SB-052/6-8(ROC) was analyzed using medium level techniques due to sample matrix. This sample and associated quality control samples were extracted together in an extraction batch but were analyzed in different analytical batches. The Method Blank VBLK 070108 and the Matrix Spike Blank MSB 070108 were analyzed in an analytical batch on 07/04/2008 that was prior to the field sample analyzed on 07/08/2008.

As a result of low volume, the sample TRIP BLANK (A8769105) was analyzed from a vial containing headspace. The volatile organic results may be biased low and all positive detections and non-detections should be considered estimated.

The analytes Acetone, 2-Butanone and Methylene Chloride were detected in the TRIP BLANK (A8769105) at a level above the reporting limit. These analytes were not detected in any of the associated samples, with the exception of sample SB-050/6-8.

The analytes Acetone and Methylene Chloride were detected in the TRIP BLANK (A8798806) at a level above the project established reporting limit. These analytes were also detected in the associated Method Blank at a similar concentration. As a result these detects have been qualified with a "B" and should be evaluated accordingly.

The results presented in this report relate only to the analytical testing and condition of the sample at receipt. This report pertains to only those samples actually tested. All pages of this report are integral parts of the analytical data. Therefore, this report should be reproduced only in its entirety.

GC/MS Semivolatile Data

The surrogate recovery for 2,4,6-Tribromophenol was above the laboratory quality control limits for sample SB-53/0-1(ROC). The surrogate recoveries for 2,4,6-Tribromophenol and p-Terphenyl-d14 were above laboratory quality control limits for samples SB-018/4-6, SB-070/6-7.5, the Matrix Spike and the Matrix Spike Duplicate of sample SB-070/6-7.5. Based on the laboratory SOP, one surrogate in each fraction (base/neutral or acid fraction) may have a recovery outside of the control limit with no corrective action necessary.

Due to a laboratory oversight, 80 ngs of internal standard was inadvertently added to samples SB-53/0-1(ROC), SB-018/4-6, SB-070/6-7.5, the Matrix Spike and Matrix Spike Duplicate of sample SB-070/6-7.5.

The spike recoveries of several analytes in the Matrix Spike and in the Matrix Spike Duplicate of sample SB-070/6-7.5 exceeded quality control limits. The associated Matrix Spike Blank recoveries were compliant, so no corrective action was performed.

Due to an oversight prior to analysis, the initial calibration curve A8I0000516-1 had only a 4 point calibration for 2,4-Dinitrophenol. This was not discovered until data review. The Methylene Chloride had evaporated from the sample vials and the associated QC. They were brought back up to the volume marker with Methylene Chloride and reanalyzed under a compliant curve for this analyte. Several of the reanalyzed samples (SB-018/4-6 RI, SB-070/6-7.5 RI, SB-070/6-7.5 MS RI, SB-070/6-7.5 MSD RI, and SBLK109 RI) had low recoveries for the first two internal standards (1,4-Dichlorobenzene-d4 and Naphthalene-d8) which would make all compounds, surrogates and spike recoveries associated with them biased high. The Matrix spiked Blank SMSB109 RI had low recoveries for the first internal standard (1,4-Dichlorobenzene-d4) which would bias all compounds, spikes and surrogates associated with this internal standard high. Samples SB-018/4-6 RI and SB-070/6-7.5 RI had low recoveries for the third internal standard (Acenaphthene-d10) which would bias all compounds, spikes and surrogates associated with this internal standard high. The reanalysis of sample SB-53/0-1(ROC) RI had low surrogate recoveries for all surrogates. Both sets of data have been reported in this data package.

Linear regression was used to calibrate all analytes, with the exception of Hexachlorocyclopentadiene, 2,4-Dinitrophenol and Pentachlorophenol, that were greater than 15% RSD in the initial calibration standard curve A8I0000516-1. A quadratic equation was used to calibrate the analytes Hexachlorocyclopentadiene, 2,4-Dinitrophenol and Pentachlorophenol that was greater than 15% RSD in the initial calibration standard curve A8I0000516-1.

The results presented in this report relate only to the analytical testing and condition of the sample at receipt. This report pertains to only those samples actually tested. All pages of this report are integral parts of the analytical data. Therefore, this report should be reproduced only in its entirety.

A quadratic equation was used to calibrate all analytes, with the exception of 2-Fluorophenol, 4,6-Dinitro-2-methylphenol, 2,4,6-Tribromophenol and Pentachlorophenol, that were greater than 15% RSD in the initial calibration standard curve A8I0000469-1. Linear regression was used to calibrate the analytes 2-Fluorophenol, 4,6-Dinitro-2-methylphenol, 2,4,6-Tribromophenol and Pentachlorophenol that was greater than 15% RSD in the initial calibration standard curve A8I0000469-1.

Linear regression was used to calibrate all analytes that were greater than 15% RSD in the initial calibration standard curves A8I0000469-2 and A8I0000536-1.

Linear regression was used to calibrate all analytes, with the exception of Benzo(k)fluoranthene, that were greater than 15% RSD in the initial calibration standard curves A8I0000399-1 and A8I0000548-1. A quadratic equation was used to calibrate the analyte Benzo(k)fluoranthene that was greater than 15% RSD in the initial calibration standard curves A8I0000399-1 and A8I0000548-1.

Sample SB-036/7.5-8(ROC), 8270 soil, had an adjusted final volume during extraction due to extract matrix and viscosity.

The chromatographic peaks for Benzo(b)fluoranthene and Benzo(k)fluoranthene could not be resolved for samples SB-002/6-8, SB-51/0-1(ROC) and SB-050/0-1(ROC) due to the sample matrix. The final value is reported as Benzo(b)fluoranthene in this data package but should be considered an and/or value for both compounds.

GC Extractable Data

For method 8081, samples SB-036/7.5-8(ROC), SB-51/0-1(ROC), and SB-51/0-1(ROC)RE required dilution prior to analysis due to the heavy matrix present. The surrogate and spike recoveries are diluted out of all sample extracts with a dilution factor of 10X or greater.

For method 8081, the recoveries of surrogate Decachlorobiphenyl in samples SB-53/0-1(ROC) and SB-53/0-1(ROC)RE were outside of established quality control limits due to the sample matrix. The recovery of surrogate Tetrachloro-m-xylene is within quality control limits; no corrective action is required.

For methods 8081 and 8082, the response of the instrument is decreased due to the heavy matrix effects from the field samples, resulting in >15% difference in the continuing calibration verifications analyzed after these sample extracts. Subsequent continuing calibration verifications demonstrated compliance with routine quality control criteria, verifying the temporary nature of this effect.

For method 8082, all sample extracts and associated quality control required treatment with Copper prior to analysis due to the presence of elemental Sulfur.

The results presented in this report relate only to the analytical testing and condition of the sample at receipt. This report pertains to only those samples actually tested. All pages of this report are integral parts of the analytical data. Therefore, this report should be reproduced only in its entirety.

For method 8081, samples were re-extracted outside of holding time due to Method Blank contamination and low spike/surrogate recoveries in the Matrix Spike Blank A8B1833801. Both sets of data has been reported and the re-extracted samples are identified with an "RE" suffix on the laboratory ID.

Metals Data

The recovery of sample SB-002/6-8 Matrix Spike and Matrix Spike Duplicate exhibited results below the quality control limits for Antimony. Sample matrix is suspect. However, the LFB was acceptable.

The Serial Dilution of sample SB-002/6-8 exceeded the quality control limits for Copper, Lead and Zinc. However, the Post Spike was compliant for these elements. Therefore, no corrective action was necessary.

"I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this Sample Data package and in the electronic data deliverables has been authorized by the Laboratory Manager or his/her designee, as verified by the following signature."

Jason R. Kacalski
Project Manager

Table with 7 columns: Internal Standards, R.T., QIon, Response, Conc Units, Dev (Min), Rcv (Ar). Rows include CI10, CI20, CI30 with various chemical names and values.

System Monitoring Compounds

Table with 7 columns: Compound ID, Name, R.T., QIon, Response, Conc Units, Dev (Min). Includes spiked amounts and recovery percentages for various compounds.

Target Compounds

Table with 7 columns: Compound ID, Name, R.T., QIon, Response, Conc Units, Dev (Min), Qvalue. Lists various target compounds and their detection results.

Handwritten signature or initials in the bottom right corner.

(#) = qualifier out of range (m) = manual integration

Handwritten notes: NO TIC, STE, 7/7/08, WA

Table with 7 columns: Internal Standards, R.T., QIon, Response, Conc Units, Dev(Min), Rcv(Ar). Rows include CI10 1,4-Difluorobenzene, CI20 Chlorobenzene-D5, CI30 1,4-Dichlorobenzene.

System Monitoring Compounds

Table with 7 columns: ID, Name, R.T., QIon, Response, Conc Units, Dev(Min). Includes recovery percentages for spiked amounts.

Target Compounds

Qvalue

Table with 7 columns: ID, Name, R.T., QIon, Response, Conc Units, Qvalue. Lists various target compounds like Dichlorodifluorometh, Chloromethane, Vinyl chloride, etc.

Handwritten signature or initials at the bottom right.

System Monitoring Compounds

3) CS50 2-Fluorophenol	4.21	112	159707	99.73	ng	0.00	
Spiked Amount	150.000	Range	21 - 110	Recovery	=	66.49%	
5) CS45 Phenol-d5	5.49	99	221601	114.87	ng	0.00	
Spiked Amount	150.000	Range	10 - 110	Recovery	=	76.58%	
6) CS70 2-chlorophenol-d4	0.00	132	0	0.00	ng		
Spiked Amount	150.000	Range	33 - 110	Recovery	=	0.00%#	
12) CS75 1,2-dichlorobenzene-d	6.15	152	162	0.15	ng	0.02	
Spiked Amount	100.000	Range	16 - 110	Recovery	=	0.15%#	
21) CS20 Nitrobenzene-d5	6.66	82	133865	76.32	ng	0.00	
Spiked Amount	100.000	Range	34 - 114	Recovery	=	76.32%	
39) CS25 2-Fluorobiphenyl	8.97	172	367371	100.86	ng	0.00	
Spiked Amount	100.000	Range	43 - 116	Recovery	=	100.86%	
59) CS55 2,4,6-Tribromophenol	10.76	330	67144	117.42	ng	0.00	
Spiked Amount	150.000	Range	10 - 123	Recovery	=	78.28%	
71) CS30 Terphenyl-d14	13.07	244	458242	86.01	ng	0.00	
Spiked Amount	100.000	Range	33 - 141	Recovery	=	86.01%
