1.0 INTRODUCTION

Day Environmental, Inc. (DAY) prepared this report for the City of Rochester (Client) in accordance with the provisions of a proposal dated March 14, 2019 and executed by the Client on April 3, 2019. This report describes the results of a Preliminary Phase II Environmental Site Assessment (Preliminary Phase II ESA) completed at the property addressed as 24 York Street, Rochester, New York (Site). The approximate 0.17-acre Site is currently an asphalt-paved parking lot that is associated with a church located on the adjoining 32 York Street parcel to the north. A project locus map is included as Figure 1.

1.1 Background

A December 20, 2017 (revised January 3, 2018) Phase I Environmental Site Assessment (Phase I ESA) report completed by DAY identified the following as recognized environmental condition(s):

1. Historic Uses of the Site

A review of historical resources indicates that the Site was used as a blacksmith shop and a wood working shop in at least 1892; a blacksmith shop, wagon shop, and painting and harness shop in at least 1912; an auto repair facility in at least 1924; a gasoline station (with at least eight underground tanks) from at least 1925 through at least 1954; an auto repair facility and blacksmith shop in at least 1929-30; a blacksmith shop in at least 1935 and 1950; an auto repair facility from at least 1941 to at least 1973; and an auto sales facility in at least 1978. The potential exists for contamination of the Site by possible discharges of hazardous and/or petroleum substances/wastes to the former building (i.e., via floor drains, etc.) or property (i.e., via underground storage tank [UST] systems).

City of Rochester records indicate that at least eight storage tanks (i.e., presumed to be USTs since the tanks were associated with a gasoline station) and six pump dispensers were installed on the Site, and that six USTs were removed from the property in 1981. As such, the possibility that additional USTs are still present on the Site could not be ruled out with the available information. In addition, tank closure documentation regarding the USTs that were known to have been removed was not provided to DAY as part of the Phase I ESA. Therefore, the conditions encountered at the time of the tank removals were not known.

City of Rochester records included permits for flammable storage and the storage of acetylene/flammable gas dated 1996 and 1997. [Note: according to City of Rochester Building Department records, buildings formerly located on the Site were demolished in 1981; the reason for the discrepancy is unknown.]

In addition, a Fire Safety Inspection dated July 1978 indicated that the Site was used as an auto painting facility; there was an “unused auto elevator to 2nd floor”; there was a “manhole-size cover over drain – south side center”; flammable paints and solvents were observed; and, violations identified included “...poor housekeeping – floor opening”.

2. Historical Uses and Regulatory Listings of Adjoining/Nearby Properties

Provided below is a summary of information that was obtained as part of the Phase I ESA that suggests a recognized environmental condition in relation to the Site that is associated with historical uses and regulatory listings of adjoining/nearby properties:

- A Federal Brownfield Site identified as “68-92 Genesee Street” located at 68-92 Genesee Street which is located approximately 0.2 miles south/southeast (i.e., assumed hydraulically crossgradient/upgradient direction) of the Site. This property is identified as a former dry cleaner, automobile sales and service facility, and a gasoline station. This property is also identified as active New York State Department of Environmental Conservation (NYSDEC) Spill/Leaking Storage Tank (LST) #1603662. Contamination at this nearby property reportedly includes tetrachloroethylene (i.e., a chlorinated volatile organic compound [CVOC]).
- Historic uses of properties that adjoin the Site to the south (i.e., assumed hydraulically crossgradient/upgradient direction) across Ruby Alley include auto repair facilities, a coal company, tailors, a milliner, a sewing machine company, a sheet metal worker, “mill remnants”, various heating contractors, etc.
- Historic uses of properties that adjoin the Site to the west (i.e., assumed hydraulically crossgradient/upgradient direction) across York Street include auto repair facilities and a locksmith.
- In addition to NYSDEC Spill #1603662 discussed above (located at 68-92 Genesee Street), the following six closed/inactive NYSDEC Spill/LST incidents occurred on adjoining/nearby properties:
 - Four NYSDEC spills (i.e., #8503751, #8706240, #8907250, and #0550459) occurred at 926-936 West Main Street, which adjoins the Site to the south across Ruby Alley (i.e., assumed hydraulically crossgradient/upgradient direction of the Site).
 - NYSDEC Spill #8906360 occurred at 32 York Street, which adjoins the Site to the north (i.e., assumed hydraulically crossgradient/upgradient direction of the Site).
 - NYSDEC Spill #1301329 occurred at 904 West Main Street, which is located approximately 30 feet (ft.) southeast (i.e., assumed hydraulically crossgradient direction of the Site) and was reported on May 8, 2013. The Spill Report Form (SRF) states, “...there was a rectangular shaped UST found at the site...Sampling results are mostly below DEC Guidelines (a few minor exceedances)...MZ indicated that a soil management plan can be prepared to address residual impacts or the impacts can be excavated”. Information previously obtained by DAY regarding this spill incident state that analytical results obtained indicated that petroleum-related semi-volatile organic compounds (SVOCs) and the metals mercury and lead exceeded their respective CP-51 guidelines for Unrestricted Use Soil Clean-Up Objectives (SCOs). In addition, benzo(a)pyrene, an SVOC was detected above its NYSDEC Part 375-6.8(b) Restricted Use SCO for a commercial site.
- Numerous properties that are located in the vicinity of the Site were included as part of an Environmental Screen of 103 parcels of land that was performed by DAY in 2009. The 2009 report indicated the potential presence of contamination on these nearby properties due to known and suspect USTs and aboveground storage tanks (ASTs), and historical uses.

1.2 Applicable Project Standards, Criteria and Guidance

The applicable standards, criteria and guidance documents that were referenced as part of this study are summarized below:

- SCOs and other guidance as set forth in 6 New York Codes, Rules and Regulation (NYCRR) Part 375 Environmental Remediation Program dated December 14, 2006.
- Guidelines referenced in the NYSDEC document titled “DER-10 Technical Guidance for Site Investigation and Remediation” dated May 2010 (DER-10).
- Soil Cleanup Levels (SCLs) and other guidance as set forth in the NYSDEC document titled “CP-51/Soil Cleanup Guidance” dated October 21, 2010.
- Groundwater standards and guidance values as set forth in the NYSDEC document titled “Division of Water Technical and Operational Guidance Series (1.1.1) Ambient Water Quality Standards and Guidance Values and Groundwater Effluent Limitations” (TOGS 1.1.1) dated June 1998 with April 2000 and June 2004 Addendums.

1.3 Purpose

The purpose of this Preliminary Phase II ESA was to complete limited intrusive studies to evaluate current conditions at the Site. The information obtained during the Preliminary Phase II ESA was used to evaluate the RECs identified above, and to develop an opinion of the current status of the RECs and whether there is a need for additional study and/or remediation.

1.4 Limitations

The findings and conclusions presented in this report are based upon an evaluation of a limited number of samples collected during this study and DAY’s interpretation of this data. Conditions between sample locations may vary. As such, the findings and conclusions presented herein should be considered as a professional opinion. If additional data becomes available in the future, it may be necessary to re-evaluate the opinions expressed in this report.

2.0 FIELDWORK AND ANALYTICAL LABORATORY TESTING

As part of this Preliminary Phase II ESA, various tasks were performed at the Site. These tasks are discussed in this section.

2.1 Geophysical Survey

DAY retained GPRS Inc. (GPRS) to complete a confirmatory geophysical survey over exterior locations of the Site to identify and map any anomalies that suggest the presence of suspected USTs and to identify the locations of subsurface utilities. GPRS utilized a GSSI Model SIR-3000 Ground Penetrating Radar (GPR) and an RD 7000/8000 Radio Frequency detector to complete the geophysical survey. Findings were painted on the ground and communicated to DAY personnel. GPRS completed the survey on April 16, 2019. The report provided by GPRS is included in Appendix A.

2.2 Subsurface Evaluation

On April 30, 2019, Nature's Way Environmental Consultants and Contractors, Inc. (Nature's Way), a subcontractor retained by DAY, advanced eight test borings (designated as TB-01-24 through TB-08-24) on the Site using a Simco Earthprobe 200 direct-push drill-rig. The test borings were advanced to equipment refusal, which was encountered at depths ranging between approximately 9.0 ft. and 10.0 ft. below ground surface (bgs). DAY personnel documented test boring locations using a Trimble Geo7x global positioning system (GPS) unit with sub-centimeter accuracy. The locations of test borings TB-01-24 through TB-08-24 are shown on Figure 2.

Upon completion of drilling, test borings TB-01-24 through TB-04-24, TB-06-24, and TB-08-24 were converted into temporary groundwater monitoring wells (designated TMW-01-24 through TMW-04-24, TMW-06-24, and TMW-08-24). Each temporary well consisted of five feet of one-inch inner diameter 10-slot Schedule 40 polyvinyl chloride (PVC) screen attached to one-inch inner diameter Schedule 40 solid PVC riser piping that extended approximately to the ground surface. The annulus between the one-inch PVC screen/riser and borehole wall was filled with sand.

A DAY representative and/or a City representative observed the work completed, made visual observations, screened soil with a photoionization detector (PID), collected soil samples for possible analytical laboratory testing, documented the lithologic conditions, and prepared the test boring logs that are included in Appendix B.

On May 1, 2019, a DAY representative purged the newly installed groundwater monitoring wells in preparation for sampling. Following recharge of the wells, groundwater samples were collected from the temporary groundwater wells for possible analytical laboratory testing. The purging and groundwater sampling activities are documented on the groundwater sampling logs included in Appendix C. Subsequent to collection of the groundwater samples, the temporary groundwater monitoring wells were decommissioned on May 1, 2019.

2.3 Analytical Laboratory Testing

Select soil samples were submitted to ALS Environmental (ALS) for testing. ALS is a New York State Department of Health (NYSDOH) Environmental Laboratory Approval Program (ELAP) certified analytical laboratory (NY Lab ID No. 10145). ALS provided analytical laboratory test results in NYSDEC Analytical Services Protocol (ASP) Category B deliverables and NYSDEC Equis deliverables. Copies of ALS's report containing the test results for the soil samples and executed chain-of-custody documentation are included in Appendix D.

2.4 Investigation-Derived Waste Disposal

Liquid and solid investigation-derived waste (IDW) generated as part of this Preliminary Phase II ESA was combined with IDW that was generated during a concurrent Preliminary Phase II ESA that was conducted on the adjoining 32 York Street parcel. The combined IDW was stored in two 55-gallon steel open-head drums on the Site. One drum contained soil from the test borings, disposable personal protective equipment (e.g., nitrile gloves), and disposable sampling equipment (e.g., sample liners, sample tubing). The other drum contained monitoring well purge water and decontamination water.

On April 30, 2019, Sample IDW-1 was collected from the solid IDW drum. The sample was subsequently submitted to ALS for testing of the parameters indicated:

- Full Toxicity Characteristic Leaching Procedure (TCLP) parameters via Methods 1311, 8260, 8270, 6010/7470, 8081, and 8151;
- Ignitability via Method 1030;
- Reactivity via Methods 9012 and 9034; and
- pH via Method 9045.

On May 1 2019, Sample IDW-2 was collected from the liquid IDW drum. The sample was subsequently submitted to ALS for testing of the parameters indicated:

- VOCs via USEPA Method 624; and
- SVOCs via USEPA Method 625

Copies of ALS's report containing the test results for the two IDW samples and executed chain-of-custody documentation are included in Appendix D.

The laboratory results were used to profile the IDW, which were determined to be non-hazardous. Disposal documentation for the two drums of IDW is included in Appendix E. In addition, the one-inch diameter PVC well screens and riser piping associated with the temporary monitoring wells was disposed in a solid waste dumpster.

3.0 FINDINGS

This section presents a summary of the findings of the work completed as part of this Preliminary Phase II ESA.

3.1 Geophysical Survey

An approximate 900 square foot area of the Site was searched for evidence of USTs. An EM pipe locator was used to attempt to passively trace any possible remaining piping underground. An anomaly that appeared to be an unknown utility was traced using the EM locator (refer to Figure 2). No evidence of remaining USTs was found using the GPR, which suggests any previous tanks have been removed. [Note: The maximum effective depth of the GPR was reported as approximately 3 feet below ground surface, which typically is deep enough to identify the upper portion of USTs.]

3.2 Subsurface Conditions

Based on the soil samples collected, apparent soil fill material was observed to extend to depths ranging between 2.5 ft. and 9.5 ft. bgs. The fill material typically consisted of silty clay intermixed with angular-subangular gravel and/or broken fieldstone. Trace to layers of ash, cinders, brick, concrete, and/or coal were observed in test borings TB-01-24, TB-02-24, TB-03-24, TB-04-24, TB-05-24, TB-06-24, and TB-08-24.

Indigenous soils beneath the apparent fill material generally consisted of silty clay. Refusal on inferred top of bedrock was encountered at depths ranging between approximately 9 ft. bgs (TB-08-24) and 10 ft. bgs (TB-03-24, TB-04-24, and TB-05-24).

Peak PID readings measured on soil samples from the eight test borings ranged between 0.0 parts per million (ppm) at TB-04-24 and 1,067 ppm at TB-08-24 at an approximate depth of 8.5 ft. bgs. Petroleum-type odors were observed on soil samples from test boring TB-02-24 at approximate depths of 6 to 9 ft. bgs; from test boring TB-03-24 at approximate depths of 5 to 6 ft. bgs; from test boring TB-04-24 at approximate depths of 0 to 1 ft. bgs; from test boring TB-06-24 at approximate depths of 7 to 9.5 ft. bgs; from test boring TB-07-24 at approximate depths of 4 to 9.5 ft. bgs; and, from test boring TB-08-24 at approximate depths of 4 to 9.5 ft. bgs. An apparent sheen was observed on the soil sample from test boring TB-06-24 at 8 to 10 ft. bgs.

Additional information encountered in each of the test borings advanced during this study is provided on the logs included in Appendix B.

Based on the field evidence of petroleum impact encountered during this Preliminary Phase II ESA, [i.e., assumed to be related to the former use of the property as a filling station with eight underground gasoline tanks and six pump dispensers (refer to Section 1.1)], a spill was reported to the NSYDEC on April 30, 2019. NYSDEC Spill File (#1901036) was opened on April 30, 2019.

The depth to groundwater measured on May 1, 2019 varied from approximately 5.11 ft. bgs (TMW-03-24) to 6.85 ft. bgs (TMW-01-24). [Note: The depth to groundwater measurements were collected less than 24 hours after installation of the temporary monitoring wells. It is possible that the water levels were not at static at the time of measurement.] A petroleum-type sheen was observed on the groundwater sample collected from temporary monitoring well TMW-06-24. Visible traces of petroleum-type light non-aqueous phase liquid (LNAPL) and a petroleum-type odor were observed on the groundwater sample collected from temporary monitoring well TMW-08-24.

Various VOCs were detected in the groundwater samples from the other four temporary monitoring wells that were tested. The concentrations of total VOCs detected in these four groundwater samples ranged between 3.86 micrograms per liter (ug/l) or parts per billion (ppb) in sample TMW-01-24 and 1,815.6 ug/l or ppb in sample TMW-08-24. 3.3.3 IDW Samples

The analytical laboratory report for the IDW samples is included in Appendix C. Table 5 and Table 6 provide a summary of the soil IDW-1 sample and liquid IDW-2 sample results, respectively. As shown on Table 5 for solid IDW, full TCLP testing was non-detect, total PCBs testing was non-detect, reactivity was non-detect, pH was 7.92, and the material was not ignitable. As shown on Table 6 for liquid IDW, VOCs generally related to petroleum, and PAH SVOCs were detected at concentrations ranging between 0.6 ug/l or ppb and 1,070 ug/l or ppb. The results were provided to SUN Environmental Corporation (SUN), which profiled the solid and liquid IDW as non-hazardous waste. On June 14, 2019, SUN picked up, transported and disposed of the drums off-site in accordance with applicable regulations (refer to disposal documentation included in Appendix E).

4.0 CONCLUSIONS AND RECOMMENDATIONS

The geophysical survey did not detect the presence of USTs within the study area at the Site, which suggests any previous tanks have been removed.

As part of the Preliminary Phase II ESA, soil samples were collected from eight test borings starting at or near the ground surface to depths ranging between 9.0 ft. and 10.0 ft. bgs where equipment refusal (i.e., inferred top of bedrock) was encountered.

- Based on visual and olfactory observations and PID screening of the samples, field evidence of potential petroleum-type impact (e.g., PID readings up to 1067 ppm, petroleum-type odors and sheen) was documented at test locations TB-01-24, TB-02-24, TB-03-24, TB-06,24, TB-07-24 and TB-08-24.
- Trace to layers of ash, coal, brick, concrete, and/or cinders was observed in fill material at each of the eight test borings (TB-01-24 through TB-08-24).

Analytical laboratory testing included five soil/fill samples for TCL and CP-51 VOCs, TCL SVOCs, and RCRA Metals, and two soil samples for PCBS.

- Various VOCs were detected in the five soil/fill samples, and the majority of the VOCs detected appeared to be petroleum related. Some of the VOC concentrations detected in four of the five soil/fill samples exceeded Unrestricted Use SCOs and/or CP-51 SCLs, but did not exceed the Restricted Residential Use SCOs or Commercial Use SCOs.
- Various polycyclic aromatic hydrocarbon (PAH) SVOCs were detected in the five soil/fill samples, which appear to be petroleum-related or fill-related. Some of the SVOC concentrations detected in two of the five soil/fill samples exceeded Unrestricted Use SCOs, Restricted Residential Use SCOs, Commercial Use SCOs, and/or CP-51 SCLs. The samples with exceedances contained fill material with ash and cinders [i.e., soil/fill sample TB-01-24(1-3) and soil/fill sample TB-06-24(4-5)].
- Each of the five soil/fill samples tested contained concentrations of lead and/or mercury that exceeded Unrestricted Use SCOs. The lead concentration in sample TB-01-24(1-3) also exceeded Restricted Residential Use SCO and Commercial Use SCO.
- PCBs were not detected at concentrations above the laboratory method detection limits.

Analytical laboratory testing included five groundwater samples for TCL and CP-51 VOCs.

- VOCs were not detected in the groundwater sample from temporary monitoring well TMW-04-24. Various VOCs were detected in the other four groundwater samples. One or more VOC concentrations detected in three of these four groundwater samples exceeded NYSDEC TOGS 1.1.1 groundwater standards or guidance values. The highest concentration of total VOCs detected in groundwater (i.e., 1,815.6 ppb) was in the sample collected from temporary monitoring well TMW-08-24 on the western Site boundary in a location where a former pump dispenser(s) would be suspected. The next highest concentration of total VOCs detected in groundwater (i.e., 411.68 ppb) was in the sample collected from temporary monitoring well TMW-02-24 located on the southwest portion of the Site in a location of a former gasoline UST.
- Petroleum sheen and/or LNAPL were detected on groundwater at temporary monitoring wells TMW-06-24 and TMW-08-24.

Conclusions

The former uses of the Site (e.g., gasoline station) have impacted soil/fill and groundwater at the Site, primarily with petroleum-related constituents. The top of petroleum-impacted soil/fill that exhibited nuisance characteristics (e.g., odors) at some of the test boring locations was encountered at depths ranging between 0.5 and 8.5 feet bgs. As a result, it is possible that petroleum-impacted soil/fill could be encountered during future subsurface work (e.g., utility work, redevelopment activities, etc.). It is unknown whether this condition is migrating via groundwater or soil vapor intrusion and impacting indoor air quality of the existing building on the adjoining 32 York Street parcel to the north.

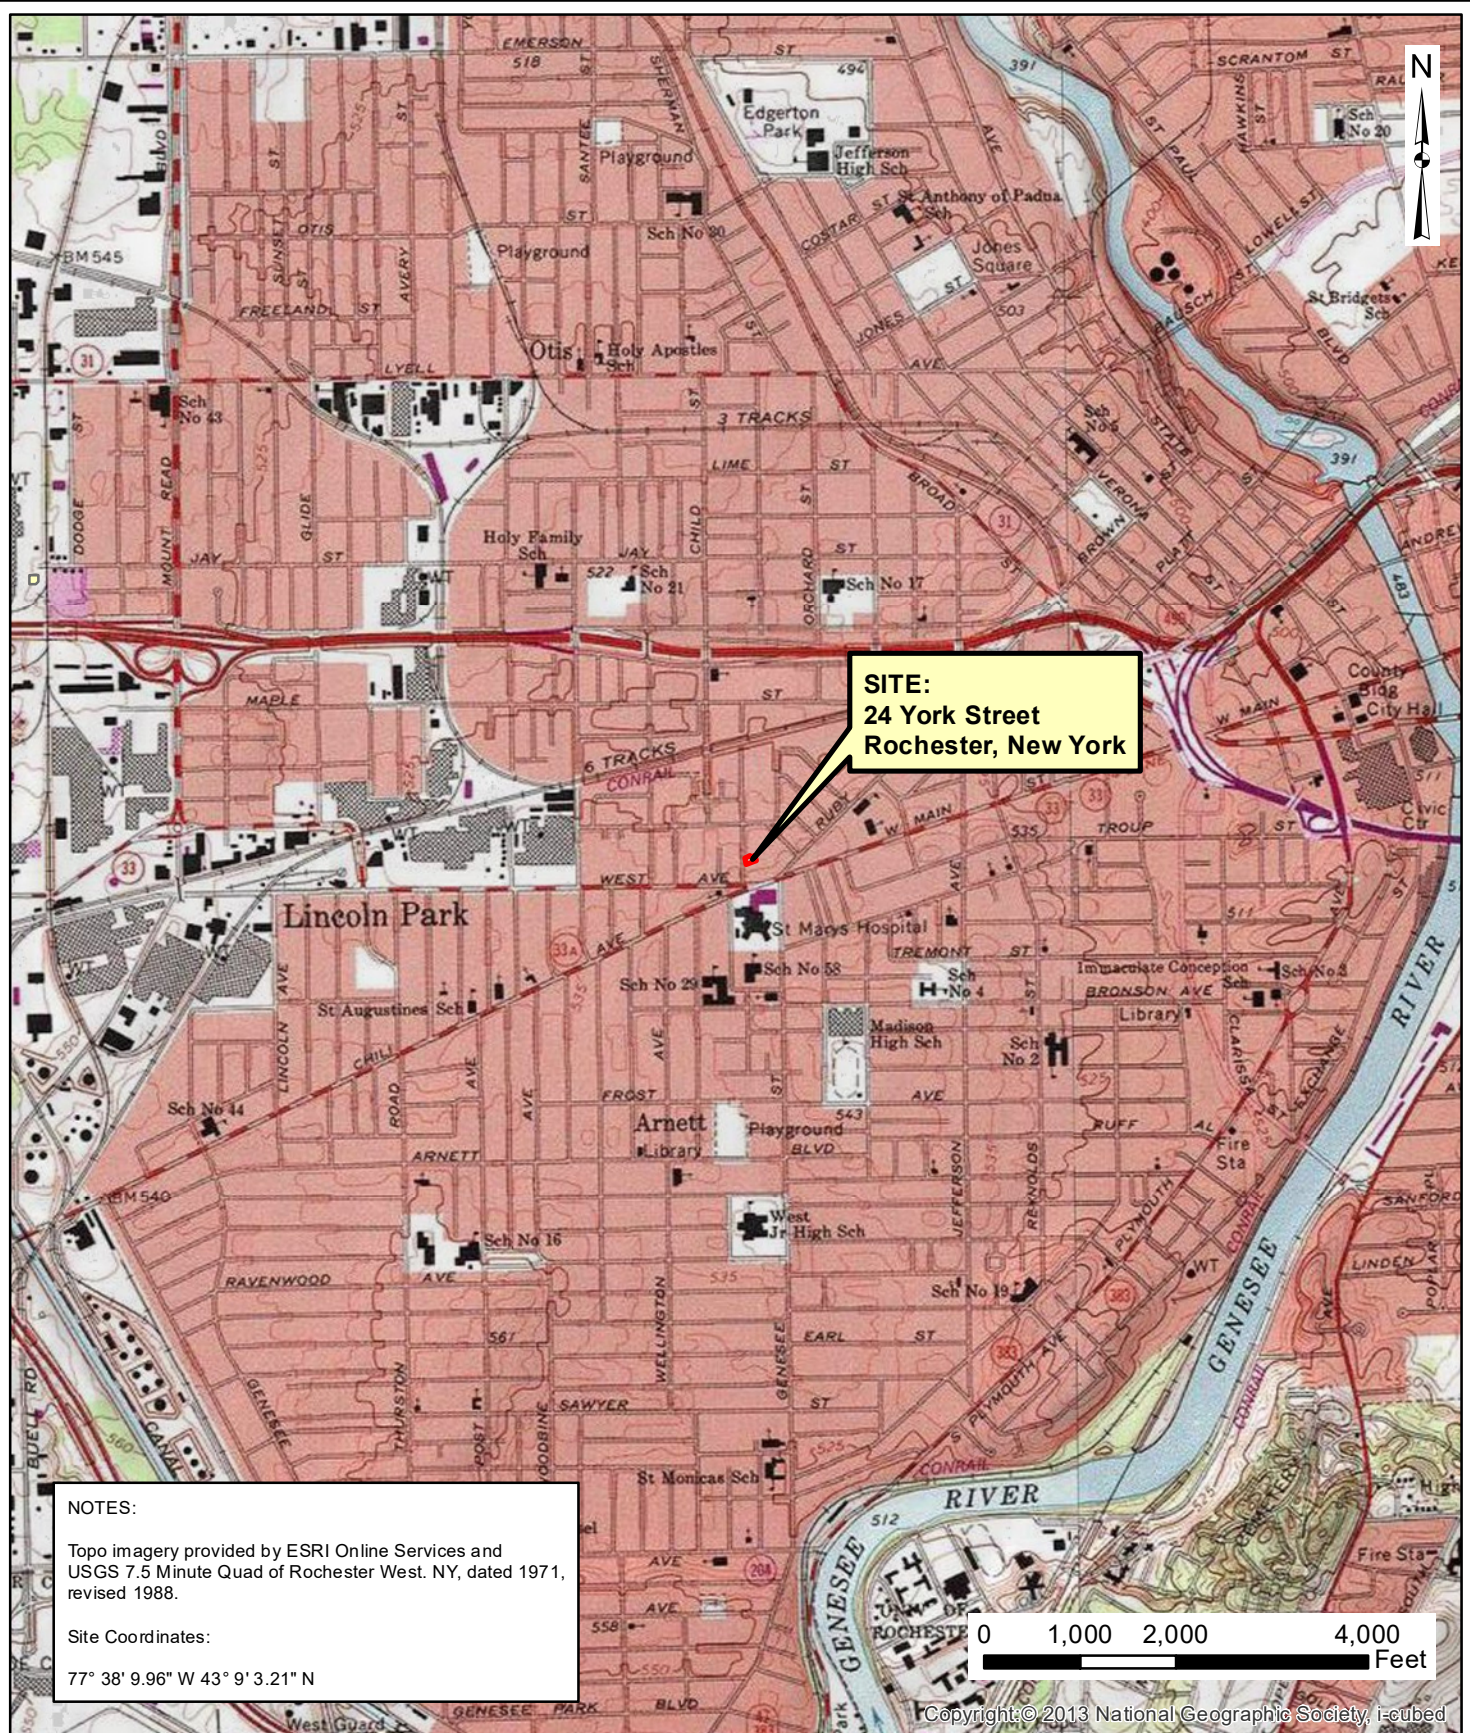

Based on SVOC, and metals (lead and mercury) concentrations and the presence of certain fill material (e.g., layers of ash), some of the soil and fill material at the Site could be considered a regulated waste if disturbed or displaced. In addition, sample TB-01-24(1-3) has the potential to be a characteristic hazardous waste, if disturbed or displaced, based on its total lead content. However, soil/fill in the area represented by this sample would require TCLP in order make such a determination. Such disturbed/displaced soil/fill would require disposal at an appropriate approved regulated disposal facility (e.g., landfill), with the exception that some types of the non-hazardous disturbed/displaced soil/fill could possibly be re-used on-site or off-site if a NYSDEC Part 360 Beneficial Use Determination (BUD) can be obtained.

Based on analytical testing completed as part of this Preliminary Phase II ESA, the historical uses and regulatory listings of adjoining/nearby properties do not appear to have impacted the Site.

Recommendations

1. It is recommended that the findings of this report be provided to the NYSDEC. With input and approval from the NYSDEC, it is recommended that additional investigation and remediation be completed in relation to the on-site petroleum impacts associated with Spill File #1901036.
2. It is recommended that the potential for soil vapor intrusion into any new structures be evaluated prior to construction, and that soil vapor intrusion be mitigated if deemed necessary.
3. It is also recommended that the fill material and other contaminants at the Site be addressed by preparing and implementing a site-specific Remedial Action Work Plan (RAWP) and/or Site Management Plan (SMP). The RAWP and/or SMP will provide guidance on health and safety monitoring, characterization, handling, and disposal/re-use of material that requires disturbance or displacement, including during redevelopment of the Site. In addition, if potentially contaminated material (e.g., material with staining, odors, free product, etc.) and/or containers/drums with contents are encountered during intrusive work (including redevelopment), further environmental assessment and/or environmental corrective actions may be warranted.

Lead Technician	JENNINGS, TREVOR	Phone	Email trevor.jennings@gprsinc.com
Thank you for using Ground Penetrating Radar Systems on your project. We appreciate the opportunity to work with you. If you have questions regarding the results of this scanning, please contact the lead GPRS technician on this project.			
EQUIPMENT USED			
The following equipment was used on this project:			
<ul style="list-style-type: none">● 400 MHz GPR antenna. Typically capable of detecting objects several feet deep. Maximum effective depth depends on site and soil conditions.● RD 7000/8000 Radio Frequency detector. Detects electromagnetic fields. Used to actively trace metallic pipes and tracer wires, or passively detect electric, communications and other lines.			
Work Performed			
Ground Penetrating Radar Systems performed the following work on this project:			
<u>Underground Tanks</u>			
Scanning the designated area to attempt to locate evidence of underground storage tanks and/or UST removal excavations. The locations of any USTs, associated piping, or excavations detected were marked with paint, flags, or other appropriate means, and results were reviewed with onsite personnel.			
<ul style="list-style-type: none">● The total area scanned was approximately 900 square feet.● Searching parcel 24 for evidence of UST's on property.● The effective depth of GPR will vary throughout a site depending on surface and soil conditions. In this area, the maximum effective GPR depth was approximately 3 feet.			

- A roughly 900 sq ft area was searched for any evidence of UST's remaining on the property within the proposed area. While no visible vent piping existed on the property, an EM pipe locator was used to attempt to passively trace any possible remaining piping underground . Within the area, an unknown anomaly was traced using the EM locator and it's location was marked on the property. However, no evidence of the pipe being UST related could be determined. Additionally, no evidence of remaining UST's were found using GPR and while this suggests any previous tanks had been removed, we cannot verify this to be fact with GPR. All findings marked in pink paint and discussed with client before departure.

Laboratory Results for: 24 York St

Dear Mr.Danzinger,

Enclosed are the results of the sample(s) submitted to our laboratory May 02, 2019
For your reference, these analyses have been assigned our service request number **R1903954**.

All testing was performed according to our laboratory's quality assurance program and met the requirements of the TNI standards except as noted in the case narrative report. Any testing not included in the lab's accreditation is identified on a Non-Certified Analytes report. All results are intended to be considered in their entirety. ALS Environmental is not responsible for use of less than the complete report. Results apply only to the individual samples submitted to the lab for analysis, as listed in the report. The measurement uncertainty of the results included in this report is within that expected when using the prescribed method(s), and represented by Laboratory Control Sample control limits. Any events, such as QC failures or Holding Time exceedances, which may add to the uncertainty are explained in the report narrative or are flagged with qualifiers. The flags are explained in the Report Qualifiers and Definitions page of this report.

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples for the Tier level IV requested by the client.

Sample Receipt:

Sixteen soil, water samples were received for analysis at ALS Environmental on 05/02/2019. Any discrepancies upon initial sample inspection are annotated on the sample receipt and preservation form included within this report. The samples were stored at minimum in accordance with the analytical method requirements.

Semivolatiles by GC/MS:

Method 8270D, 05/07/2019: The upper control limit was exceeded for one or more analytes in the Continuing Calibration Verification (CCV). The field samples analyzed in this sequence did not contain the analyte(s) in question above the Method Reporting Limit (MRL). Since the exceedance equates to a potential high bias, the data quality was not significantly affected and no further corrective action was taken.

Method 8270D, 05/07/2019: The lower control limit was exceeded for one or more analytes in the Continuing Calibration Verification (CCV). Since there were no detections of the analyte(s) in the associated field samples, the quantitation is not affected. The data quality was not significantly affected and no further corrective action was taken.

Method 8270D, R1903954-008, -010: Sample(s) required dilution due to the dark oily nature of the extract. The reporting limits are adjusted to reflect the dilution.

Semivolatile GC:

Method 8082A, 05/08/2019: The lower control limit was exceeded for one or more analytes in the Continuing Calibration Verification (CCV) on the confirmation column. The field samples analyzed in this sequence did not contain the analyte(s) in question above the Method Reporting Limit (MRL). The data quality was not significantly affected and no further corrective action was taken.

Metals:

No significant anomalies were noted with this analysis.

General Chemistry:

No significant anomalies were noted with this analysis.

Volatiles by GC/MS:

Method 8260C, 05/08/2019: The lower control limit was exceeded for one or more analytes in the Continuing Calibration Verification (CCV). Since there were no detections of the analyte(s) in the associated field samples, the quantitation is not affected. The data quality was not significantly affected and no further corrective action was taken.

Method 8260C, 05/10/2019: The lower control limit was exceeded for one or more analytes in the Continuing Calibration Verification (CCV). Since there were no detections of the analyte(s) in the associated field samples, the quantitation is not affected. The data quality was not significantly affected and no further corrective action was taken.

REPORT QUALIFIERS AND DEFINITIONS

- | | |
|---|---|
| <p>U Analyte was analyzed for but not detected. The sample quantitation limit has been corrected for dilution and for percent moisture, unless otherwise noted in the case narrative.</p> <p>J Estimated value due to either being a Tentatively Identified Compound (TIC) or that the concentration is between the MRL and the MDL. Concentrations are not verified within the linear range of the calibration. For DoD: concentration >40% difference between two GC columns (pesticides/Aroclors).</p> <p>B Analyte was also detected in the associated method blank at a concentration that may have contributed to the sample result.</p> <p>E Inorganics- Concentration is estimated due to the serial dilution was outside control limits.</p> <p>E Organics- Concentration has exceeded the calibration range for that specific analysis.</p> <p>D Concentration is a result of a dilution, typically a secondary analysis of the sample due to exceeding the calibration range or that a surrogate has been diluted out of the sample and cannot be assessed.</p> <p>* Indicates that a quality control parameter has exceeded laboratory limits. Under the "Notes" column of the Form I, this qualifier denotes analysis was performed out of Holding Time.</p> <p>H Analysis was performed out of hold time for tests that have an "immediate" hold time criteria.</p> <p># Spike was diluted out.</p> | <p>+ Correlation coefficient for MSA is <0.995.</p> <p>N Inorganics- Matrix spike recovery was outside laboratory limits.</p> <p>N Organics- Presumptive evidence of a compound (reported as a TIC) based on the MS library search.</p> <p>S Concentration has been determined using Method of Standard Additions (MSA).</p> <p>W Post-Digestion Spike recovery is outside control limits and the sample absorbance is <50% of the spike absorbance.</p> <p>P Concentration >40% difference between the two GC columns.</p> <p>C Confirmed by GC/MS</p> <p>Q DoD reports: indicates a pesticide/Aroclor is not confirmed (>100% Difference between two GC columns).</p> <p>X See Case Narrative for discussion.</p> <p>MRL Method Reporting Limit. Also known as:</p> <p>LOQ Limit of Quantitation (LOQ)
The lowest concentration at which the method analyte may be reliably quantified under the method conditions.</p> <p>MDL Method Detection Limit. A statistical value derived from a study designed to provide the lowest concentration that will be detected 99% of the time. Values between the MDL and MRL are estimated (see J qualifier).</p> <p>LOD Limit of Detection. A value at or above the MDL which has been verified to be detectable.</p> <p>ND Non-Detect. Analyte was not detected at the concentration listed. Same as U qualifier.</p> |
