Executive summary

Background

This Feasibility Study (FS) was developed for the P-1 Plume located at 1700 Emerson Street in the City of Rochester, Monroe County, New York on the Former Emerson Street Landfill (FESL) (refer to Figure 1). The FESL consists of approximately 250-acres of land comprised of 45 individual parcels of which 7 are owned by the City of Rochester. The FESL operated as a municipal landfill beginning between sometime in the 1940s and 1951 until 1971. This FS is submitted as part of the Order on Consent and Administrative Settlement #B8-0798-09-01 and was completed in accordance with New York State Department of Environmental Conservation (NYSDEC) Division of Environmental Remediation (DER) *Technical Guidance for Site Investigation and Remediation* (“DER-10”). A Remedial Investigation (RI) was conducted from 2012-2017 and built upon previous investigations at the Site completed in the late 1980s, 1994 and 2001. A portion of the FESL that includes three parcels addressed as 1660, 1700 and 1740 Emerson Street is designated by the New York State Department of Environmental Conservation (NYSDEC) as Inactive Hazardous Waste Disposal Site (IHWDS) Site #828023 (refer to Figure 2). The purpose of the RI was to investigate a plume of chlorinated volatile organic compounds (CVOCs) emanating from the 1700 Emerson Street parcel (formerly part of the 1655 Lexington Avenue parcel) which is located in the portion of the FESL where direct burial of unincinerated waste occurred in the late 1960s just before landfill closure. The plume of CVOCs has been designated as the P-1 Plume. Previous investigations conducted since the 1980s have investigated the FESL and have not identified significant CVOC impacts associated with FESL-related releases with the exception of the P-1 Plume (refer to Figure 3). Furthermore, soil vapor intrusion (SVI) assessments conducted from 2009-2017 across the FESL have not identified FESL-related SVI in Site Buildings with the exception of the closest downgradient building to the P-1 Plume (i.e., located on the adjoining 1740 Emerson Street parcel).

Conceptual Site Model

During the last years of filling at the FESL or potentially after closure of the FESL, it appears some non-municipal waste was placed in the landfill in the vicinity of P-1 and more specifically in the area encompassed by 2013-SB-01, LAB-OBW-01, 2016-SB-19, 2016-SB-20, LAB-DBW-01, LAB-SBW-02, LAB-SBW-09 and LAB-SBW-10 (refer to Figure 4 for locations). This is supported by a review of aerial photographs, test pits, high concentrations of impacts in the overburden/ fill on top of bedrock, the presence of the greatest concentrations of CVOCs in A Zone groundwater, and bedrock matrix samples. The A-Zone is comprised of the upper 3-ft of highly fractured and weathered top of bedrock and includes the lowermost portion of saturated overburden, where present.

NAPL and/or highly impacted groundwater appear to have migrated laterally and vertically from this source area. Based on rock matrix analysis, impacts migrated to the southeast to LAB-SBW-05 in the A Zone and Upper B Zone. The Upper B Zone spans the bedrock thickness between the A-Zone and B-Zone (3-8-feet (ft) below top of rock (btr)). Impacts (not NAPL) further migrated laterally to the west and southwest (LAB-SBW-13 and LAB-SBW-14) and to the south (LAB-SBW-15 and LAB-SBW-16) into the B Zone. This is evidenced by

- i -

Feasibility Study
NYSDEC Site #828023
Former Emerson Street Landfill- P-1 Plume
Rochester, New York
LaBella Project No. 210173

greater concentrations of CVOCs in the B Zone than in the A Zone in these locations. Impacts have not migrated at significant concentrations laterally to the southeast or vertically to the C or D Zones defined as 16-25-ft btr and greater than 25-ft btr, respectively.

As the impacts have migrated downward vertically and laterally, natural degradation has been occurring. This is evidenced by greater concentrations of daughter compounds than parent compounds in bedrock groundwater. In addition the source edge bedrock samples have a higher proportion of daughter compounds than the samples in the source area. Furthermore, the overall P-1 Plume area has decreased since 2000 and concentrations of total CVOCs have declined. The source area of CVOCs in groundwater (encompassed by 2013-SB-01, LAB-OBW-01, 2016-SB-19, 2016-SB-20, LAB-DBW-01, LAB-SBW-02, LAB-SBW-09 and LAB-SBW-10) is approximately 16,000 sq. ft. as shown on Figure 5.

In accordance with the EPA Technical Protocol Table 2.4 evaluation that was performed as part of the RI, there is “*Adequate Evidence for anaerobic biodegradation (reductive dechlorination) of chlorinated organics*”. Additionally, compound-specific isotope analysis (CSIA) results indicate natural transformation of parent material (PCE and TCE) to daughter products is occurring. The mechanism for transformation was evaluated using Bio-Trap samplers. Analytical results indicate the presence of DHC (Dehalococcoides) and DHBt (Dehalobacter) in population ranges capable of natural biodegradation of CVOCs in the P-1 study area; however, biodegradation appears to be incomplete prior to regulated contaminants leaving the property boundary. This is supported by the fact that chloroethane, cis-1,2-dichloroethene, and vinyl chloride are detected in the downgradient wells (GMX-MW-3, LAB-SBW-15 and LAB-SBW-16). Refer to Figure 5 for a conceptual Site model of the P-1 Plume.

It should be noted that the RI included assessment of 1,4-dioxane and perfluorinated compounds (PFCs). Based on relatively minor exceedances of NYSDEC criteria and the fact that surrounding properties are serviced by City drinking water, these compounds are assumed to not require active remediation and thus are not included in the assessment for remedial alternatives.

P-1 Plume Pilot Test

A pilot test was conducted to assess a potential remedial technology to be implemented for remediation of the P-1 Plume. The Pilot Test Work Plan was conditionally approved by the NYSDEC in a letter dated September 28, 2017. The pilot test assessed the viability of in-situ chemical reduction (ISCR) via a permeable reactive barrier (PRB) consisting of zero valent iron (ZVI). The PRB was installed via two (2) different injection technologies; 1) blast-enhanced bedrock trench; and 2) pneumatic injections. The pilot test commenced in October 2017 and was completed in November 2017. Groundwater monitoring was conducted approximately 2 months, 3.5 months, and 7 months subsequent to the ISCR pilot test injections. The pilot test and monitoring results were documented in a *Pilot Test Monitoring Report* dated April 2019 included as Appendix 1 (note this report is not yet approved by NYSDEC and NYSDOH). Based on the pilot test results, ZVI would be successful in constructing a PRB to meet the remedial action objectives and both delivery methods would be successful in constructing a PRB to meet the remedial action objectives.

Evaluation of Alternatives

An initial identification and screening of alternatives was conducted to select remedial alternatives for further evaluation. The following table represents alternatives initially screened for the P-1 Plume.

P-1 Plume Initial Screening of Remedial Alternatives

General Remedial Scenario	Remedial Technology	Selected for Further Evaluation	Explanation
No action	None	No	No action will not meet any of the criteria in DER 10 Section 4.2.
In-Situ Biological Treatment	Enhanced Bioremediation	No	Microorganisms are present and biological treatment is occurring.
	Bioventing	No	Microorganisms are present and biological treatment is occurring.
	Monitored Natural Attenuation (MNA)	Yes	Natural attenuation of CVOCs in groundwater is occurring.
In-Situ Chemical/ Physical Treatment	Chemical Oxidation	No	Due to high chemical oxidant demand of bedrock matrix, chemical oxidation is not feasible.
	Chemical Reduction	Yes	Potential source treatment and permeable reactive barrier.
	Thermal Treatment	Yes	Potential source treatment.
	Dual Phase Extraction	Yes	Treat contaminated groundwater and soil vapor.
Ex-Situ Chemical/ Physical Treatment	Excavation	Yes	Source removal option.
	Pump and Treat	Yes	Treat contaminated groundwater on-Site.
	Bioreactor	No	Large volume of contaminated media.
Containment	Grout Wall	No	Groundwater gradient is not steep. Large aerial extent of plume.
	Cap/ Cover	Yes	Limit exposure to subsurface contaminants.

The following alternatives were selected for further evaluation:

- Excavation
- Thermal Treatment - Electrical Resistance Heating (ERH)
- Groundwater Extraction and Ex-Situ Treatment System
- In-Situ Source Treatment and Permeable Reactive Barrier (PRB)

- iii -

Feasibility Study
 NYSDEC Site #828023
 Former Emerson Street Landfill- P-1 Plume
 Rochester, New York
 LaBella Project No. 210173

- PRB with monitored natural attenuation (MNA)
- MNA
- Cap/ Cover

The alternatives were evaluated based on the following criteria as defined in NYSDEC DER-10 Section 4.2:

- Overall Protection of Human Health and the Environment
- Compliance with Standards, Criteria and Guidelines (SCGs)
- Long-Term Effectiveness
- Short-Term Impact and Effectiveness
- Reduction of Toxicity, Mobility, or Volume
- Ease of Implementation
- Cost-Effectiveness
- Appropriate based on Future Anticipated Land Use
- Green Remediation

Community acceptance will be evaluated during a public comment period; as such, community acceptance is not evaluated herein. The following table summarizes the results of the evaluation.

Summary of Evaluation of Alternatives – P-1 Plume

Alternative	Protection of Human Health and the Environment	Compliance with SCGs	Long-Term Effectiveness	Short-Term Effectiveness	Reduction of Toxicity, Mobility or Volume	Ease of Implementation	Cost-Effective	Appropriate based on Future Anticipated Land Use	Green
A. Excavation		X	X	X	X			X	
B. Electrical Resistance Heating	X	X	X	X	X			X	X
C. Groundwater Extraction and Ex-Situ Treatment System	X	X*	X	X	X			X	
D. In-Situ Source Treatment with PRB	X	X*		X	X			X	X
E. Permeable Reactive Barrier with Monitored Natural Attenuation	X	X*	X	X	X	X	X	X	X
F. Monitored Natural Attenuation		X*	X			X	X	X	X

Shaded row indicates selected alternative.

* indicates alternative will comply with SCGs in the top 1-ft with ICs and ECs in place and SCGs may be achieved in the subsurface in the long term as CVOCs in groundwater degrades via natural attenuation. A cap/ cover will be applied for all alternatives to meet SCGs in the top 1-ft across the entire Site.

Feasibility Study
 NYSDEC Site #828023
 Former Emerson Street Landfill- P-1 Plume
 Rochester, New York
 LaBella Project No. 210173

A cost comparison is provided below.

Alternative		Capital Cost	O&M Present Value (30 years)	Total Present Value (with 30 year O&M)
A	Excavation	\$ 24,483,000	\$ 208,000	\$ 24,691,000
B	ERH	\$ 5,581,000	\$ 208,000	\$ 5,789,000
C	Groundwater Extraction and Ex-Situ Treatment System	\$ 2,931,000	\$ 1,497,000	\$ 4,428,000
D1	In-Situ Source Treatment with PRB (blasted bedrock trench)	\$ 4,878,000	\$ 1,754,000	\$ 6,632,000
D2	In-Situ Source Treatment with PRB (pneumatic)	\$ 5,115,000	\$ 1,971,000	\$ 7,086,000
E1	PRB & MNA (blasted bedrock trench)	\$ 1,553,000	\$ 1,755,000	\$ 3,308,000
E2	PRB & MNA (pneumatic)	\$ 1,777,000	\$ 1,919,000	\$ 3,696,000
F	MNA	\$ 1,039,000	\$ 463,000	\$ 1,502,000

The recommended alternative is PRB with MNA. While the blast enhanced bedrock trench injection method is more cost effective than the pneumatic injection method, the delivery method will be selected and determined and detailed in a Remedial Action Work Plan.

In addition to the recommended PRB with MNA, institutional controls (ICs) and engineering controls (ECs) will be implemented in order to comply with applicable SCGs. A cover system will be constructed over the 1700 Emerson Street parcel as an EC to prevent exposure to subsurface material and comply with SCGs. Costs for constructing the cover system and preparing/ implementing ICs including SMP and environmental easement, is included in each alternative.

1. Introduction

This Feasibility Study (FS) was developed for the P-1 Plume located at 1700 Emerson Street (formerly 1655 Lexington Avenue) in the City of Rochester, Monroe County, New York on the Former Emerson Street Landfill (FESL) (refer to Figure 1). This FS was completed in accordance with New York State Department of Environmental Conservation (NYSDEC) Division of Environmental Remediation (DER) *Technical Guidance for Site Investigation and Remediation* (“DER-10”). A Remedial Investigation (RI) was conducted from 2012-2017 which built upon previous investigations completed at the Site in the late 1980s, 1994 and 2001. Previous investigations have evaluated groundwater across the FESL and have identified one (1) chlorinated volatile organic compound (CVOC) groundwater plume associated with the FESL, known as the P-1 Plume located at 1700 Emerson Street.

A portion of the FESL is designated as Inactive Hazardous Waste Disposal Site (IHWDS) Site #828023. A majority of the FESL has been delisted from the IHWDS; however, three (3) parcels (1660, 1700, and 1740 Emerson Street) comprising approximately sixteen (16) acres are currently listed as a Class 3 site on the NYSDEC Registry of Inactive Hazardous Waste Disposal Sites. A “3” classification indicates a site “at which contamination does not presently constitute significant threat to public health or the environment.” For the purpose of this evaluation, “the Site” refers to the IHWDS Site including 1660, 1700 and 1740 Emerson Street (refer to Figure 2).

On December 9, 2014 LaBella submitted a Delisting Petition for the parcel currently addressed as 1655 Lexington Avenue (formerly 1635 Lexington Avenue and a portion of former 1655 Lexington Avenue) to delist approximately 13.3 acres of land from the NYSDEC Registry of IHWDS. The NYSDEC approved this delisting on March 19, 2015, and the newly delisted land was combined into one parcel with an address of 1655 Lexington Avenue. The remaining portion of former 1655 Lexington Avenue was renamed 1700 Emerson Street.

The City entered into an Order-On-Consent with the NYSDEC in 2009. The Order-on-Consent initially required the development and implementation of a soil vapor intrusion (SVI) Work Plan. The SVI Work Plan was developed, approved by NYSDEC and implemented from 2009-2011. The work included soil and groundwater sampling across the FESL as well as SVI assessments at buildings on the FESL. The findings of the initial SVI assessment were detailed in a report titled *Soil Vapor Intrusion Assessment Report: Data Review, Site Screening & Site Prioritization* dated June 2011 (hereinafter referred to as the “2011 SVI Assessment Report”). The 2011 SVI Assessment Report identified several buildings at a risk of SVI due to the FESL. Subsequently, a work plan titled *Soil Vapor Intrusion Investigation Work Plan: Phase II Parcel Specific Investigation* (hereinafter referred to as the “SVI Work Plan”) was submitted to the NYSDEC and NYSDOH in April 2013 to complete SVI sampling within the buildings determined to be at high risk for SVI due to the FESL. The NYSDEC and NYSDOH provided comments to the SVI Work Plan on April 23, 2015 and the SVI Work Plan Work Plan was resubmitted in January 2016 to address the NYSDEC and NYSDOH comments. The SVI Work Plan was implemented beginning in March 2016 and two (2) of the seven (7) buildings tested required mitigation; 575 Colfax Street and 1740 Emerson Street. It should be noted that only the 1740 Emerson Street building was determined to require mitigation as a result of CVOCs due to the FESL (i.e., the P-1 Plume). The owners of 575 Colfax Street and 1740 Emerson Street were notified

about SVI conditions. Subsequently, mitigation systems were installed/ activated in the buildings at 575 Colfax Street and 1740 Emerson Street and Construction Completion Reports have been provided to the NYSDEC and NYSDOH for review in September 2018 (these reports have not yet been approved by NYSDEC and NYSDOH).

The findings of the SVI Investigation were detailed in a draft report titled *Soil Vapor Intrusion Investigation Report* dated March 2018. This report has not yet been approved by the NYSDEC and NYSDOH. For properties where SVI testing was completed and it was determined that SVI mitigation was not warranted, property-specific reports were developed, approved by the NYSDEC and NYSDOH, and provided to each property owner. Owners of properties that did not warrant SVI testing were notified that no further work was required due to the FESL. The above reports should be referenced for additional details regarding SVI at the FESL. Based on the work completed to investigate and address SVI, SVI is no longer considered a complete exposure pathway at the Site and any remedy will include these engineering controls.

Previous investigations have been conducted at the FESL since the 1980s, which includes the most recent Remedial Investigation (RI) for the P-1 Plume that was conducted in accordance with the *Remedial Investigation Work Plan: P-1 Plume Area* dated November 2012 and five (5) subsequent addenda. The purpose of the RI was to define the nature and extent (areal and vertical extent) of VOCs, specifically CVOCs in soil, fill, groundwater and the bedrock matrix in the vicinity of the P-1 Plume. Previous investigations have identified CVOCs including trichloroethene (TCE), tetrachloroethylene (PCE) and breakdown compounds (mainly vinyl chloride and cis-1,2-dichloroethene) in groundwater at concentrations up to 69 parts per million (ppm) total CVOCs in groundwater.

2. Site Description and History

The FESL consists of approximately 250-acres of land comprised of 45 individual parcels of which 7 are owned by the City of Rochester (Refer to Figure 2 for FESL footprint). The remaining 38 parcels are owned by 25 private owners. The FESL is predominantly occupied by industrial and commercial properties (15 and 20, respectively based on use codes). In addition, City use codes indicate 5 parcels as vacant land, one parcel as unknown (McCrackanville Street) and 4 parcels are listed as community/public service (one of which is a school, Edison Tech). The surrounding area generally contains industrial and commercial properties. Residential properties are also located to the northeast. The three (3) parcels included in the IHWDS (1660, 1700, and 1740 Emerson Street) are zoned M-1, Industrial District.

Prior to FESL landfilling operations, the area was primarily vacant and relatively flat lying, with a wetland located in the north-central portion of the site. As a result of landfilling activities, the FESL site has been elevated approximately 15+ feet above the surrounding area. An industrial park presently occupies most of the FESL site, including larger facilities and various smaller industrial/commercial facilities, as well as several undeveloped parcels and undeveloped land on otherwise developed parcels.

The FESL was operated by the City as a landfill beginning between sometime in the 1940s until 1971. The landfill was used to dispose of ash derived from the incineration of municipal solid waste at the City's incinerators which were located south of Emerson Street and east of Colfax Street on

- 2 -

the FESL. Ash fill and construction and demolition debris were the primary waste materials placed in the landfill. Landfilling began south of Emerson Street and gradually expanded northward and eastward to include areas between Emerson Street, Lexington Avenue, Colfax Street and Lee Road, and south of Emerson Street to the east and west of Colfax Street. Fires due to incomplete incineration of municipal solid waste and open burning of refuse reportedly occurred in the late 1960s and early 1970s due to operational problems with the incinerators. Fill during this timeframe was north of Emerson Street. In May of 1971, the City's incinerators were shut down; however, un-incinerated municipal refuse continued to be placed north of Emerson Street until August of 1971. In August 1971, refuse disposal was ceased at FESL and disposal shifted to a different county landfill. In 1971, the landfill was officially closed and a contract for the closure of the eastern half of the landfill specified 2 feet of cover material (preferred to be a sandy loam) to be placed and compacted to 30% in 1 foot lifts. In September 1971, a contract was awarded for the closure of the western portion of the landfill. Since closure, portions of the Site have been developed by various private parties.

The general types of wastes encountered during investigations at the FESL site include the following:

- Municipal Incinerator Ash - generally consisting of ash, cinders, charred refuse, glass and metal slag. Most ash observed in site investigations appears to be fly ash and bottom ash (clinker) from the municipal solid waste incinerators. This generally consists of soil and rock fill with traces of plastic, metal, wood, concrete, bricks, tiles, and asphalt. Construction and demolition debris observed in past investigations generally fits the definition of construction and demolition debris contained in NYSDEC's Part 360. Construction demolition debris fill is common in areas adjacent to current and former roadways on site, and particularly in the lobe of fill south of Emerson Street and east of Colfax Street.
- Soil and Municipal Refuse - This material generally consists of silty sand cover material and disposed, un-incinerated municipal refuse.
- Low-activity Radioactive Waste - This material was encountered in a small area south of Emerson Street and consisted of a sludge-like waste material associated with glass lenses. The sludge was found to contain low levels of radioactive thorium. This material was primarily encountered in a relatively small area in the southwest portion of the FESL and was associated with incinerator ash and refuse fills. This material was removed by Severson Environmental Services on behalf of the City of Rochester.
- The majority of the existing landfill has a soil cover. Cover ranges in thickness from 0 ft. up to approximately 6 ft. Cover materials generally consist of topsoil with grass, gravel, asphalt, or glacial till-derived sandy silt.

The FESL can be separated into four general geographic regions, or quadrants, based on the landfill waste composition aerial photograph interpretation of landfill deposition, and historic analytical data. Refer to Figure 3 for quadrant locations. A summary of the types of waste at each quadrant is as follows:

Quadrants A and B (North of Emerson Street, East of Lee Road, West of Colfax Street):

Portions of Quadrants A and B were filled during the 1970's, the last years of the landfill's operational life. At this time the incinerator was no longer operating properly, resulting in un-incinerated putrescible waste being deposited in the landfill during that period. These portions of the landfill are characterized by thicker fill, higher percentage of potentially putrescible solid

waste and less incinerated ash, and higher landfill gas flux at the surface relative to other FESL areas sampled. These areas are characterized by landfill gas flux measurements between 100 and 1200 $\mu\text{g}/\text{m}^2\text{-minute}$, and/or soil gas methane concentrations above 5,000 ppm. In addition, these quadrants have also been characterized with CVOC contamination in soil gas, soil, and groundwater. Quadrant A is distinguishable from Quadrant B by a large area of documented CVOC contamination present in Quadrant A. The listed IHWDS portions of the landfill (i.e., 1660m 1700 and 1740 Emerson Street) are located within Quadrant A.

Quadrant C (South of Emerson Street, East of Colfax Street):

Quadrant C is characterized by thinner fill, lower percentage of potentially putrescible solid waste and more incinerated ash, and intermediate landfill gas flux at the surface relative to other FESL areas sampled. This area is characterized by landfill gas flux measurements below 50 $\mu\text{g}/\text{m}^2\text{-minute}$. It has been hypothesized that the gas detections may be related to the presence of organic rich marsh-derived soils at depth in this area, as opposed to landfill related gas. There is also an area of CVOC contamination in this quadrant.

Quadrant D (South of Emerson Street, West of Colfax Street):

Quadrant D is characterized by thinner fill, lower percentage of potentially putrescible solid waste and ash that was more efficiently and completely incinerated, and lower landfill gas flux at surface relative to other FESL areas sampled. This area is characterized by landfill gas flux measurements between 50 and 200 $\mu\text{g}/\text{m}^2\text{-minute}$. In addition, there are several small areas of CVOC contamination in this quadrant, which may be the result of post-landfill industrial activity as opposed to landfill operations. State and federal wetlands are also located within this quadrant.

3. Previous Investigations

A significant number of investigations have been previously conducted across the FESL. In addition to investigation reports, there are two (2) current guidance documents applicable to Site development on the FESL:

- *Former Emerson Street Landfill Sub-Slab Ventilation Guidance Document Update 2013* by LaBella dated October 2013
- *Guidance for Waste-fill Management During Site Development on the Former Emerson Street Landfill* by LaBella dated October 2013

The following subsections include a summary of recent relevant reports; a more detailed review can be obtained from each individual report.

3.1 Soil Vapor Intrusion

This subsection summarizes relevant SVI reports completed for the FESL.

Soil Vapor & Intrusion Assessment Report (SVI Assessment Report) dated June 2011:

LaBella conducted a SVI assessment including a detailed review of historic information available for the Site. The historic information included not only previous subsurface environmental investigations but also a detailed review of aerial photography, subsurface data

from redevelopment projects (i.e., geotechnical borings and test pits), available newspaper articles from the time the landfill was operating, and reports/papers relating to City of Rochester and Monroe County waste handling and disposal practices both historically and in particular in the 1960s/1970s. In addition, groundwater sampling of existing wells was completed, additional groundwater monitoring wells were installed, developed and sampled and a site reconnaissance was conducted at every parcel where access was granted by the property owner.

The results of the cumulative work were utilized in a ranking system that used weighted numerous criteria for each building based on non-FESL factors and FESL-related factors.

The weighting/prioritization work resulted in developing three scores for each property: 1) FESL related factors score, 2) Non-FESL related factors score, and 3) overall prioritization score. The overall scores were separated into three “Tiers” of sites. Tier 1 sites were determined to be of the highest concern for SVI due to the FESL, Tier 2 sites were determined to be of moderate to low concern for SVI due to the FESL and Tier 3 sites were determined to be of low to no concern for SVI due to FESL.

Tier 1 Properties: The initial SVI assessment identified eight (8) buildings as Tier 1. This represents approximately 21% of the building space on the FESL at the time of the assessment. Tier 1 properties are all in proximity to the P-1 Plume (refer to Figure 2). Tier 1 buildings were determined to be of highest concern for SVI due to the FESL.

Tier 2 Properties: Twelve (12) buildings were considered Tier 2 which represents approximately 27% of the building space on the FESL at the time of the assessment. Tier 2 buildings were determined to be of moderate to low concern for SVI due to the FESL.

Tier 3 Properties: Nineteen (19) buildings were considered Tier 3 which represents 49% of the building space on the FESL at the time of the assessment. Tier 3 buildings were determined to be of low to no concern for SVI due to the FESL.

In addition to the above rankings, there were ten (10) vacant or undeveloped properties, eight (8) buildings not designed for occupancy (e.g., sheds, warehouse space, RG&E substation). Also, two (2) buildings and an addition on a Tier 2 Building had active mitigation systems already in place.

Soil Vapor & Intrusion Investigation Report (SVI Investigation Report) (Draft):

Following the SVI Assessment, a SVI Work Plan was developed to investigate the seven (7) Site Buildings ranked to be at the highest risk for FESL-related SVI (i.e., Tier 1) including 1640 Emerson Street, 1645-1685 Emerson Street, 1769 Emerson Street (Resource Recovery Facility building), 1770 Emerson Street, 500 Lee Road, 575 Colfax Street, and 1740 Emerson Street. It should be noted the transfer station at 1769 Emerson Street was ranked Tier 1 property but it does not include office areas except a small office with a unit heater. The transfer station is open to the outside air during operations and; as such, was not recommended for SVI investigation. SVI testing was completed at the seven (7) Tier 1 buildings between March 2016 and February 2017 and consisted of collocated sub-slab and indoor air samples, biased towards office areas, with the exception of 500 Lee Road at which exterior soil gas sampling was conducted due to building use and building construction. SVI testing was

- 5 -

completed in accordance with the SVI Work Plan and *NYSDOH Guidance for Evaluating Soil Vapor Intrusion in the State of New York* dated October 2006 and subsequent updates dated September 2013 and August 2015 (NYSDOH Guidance). It should be noted that the NYSDOH Guidance Decision Matrices were updated in May 2017; however, the updated values did not change any of the final decisions arrived at using the previous matrices for samples collected during this assessment. The results for each building tested for SVI are summarized below:

- **1640 Emerson Street**– This property was recommended for SVI (sub-slab/indoor air) testing based on the 2011 SVI Assessment Report. Results of the SVI testing indicated no further action was warranted.
- **1645-1685 Emerson Street**– This property was recommended for SVI (sub-slab/indoor air) testing based on the 2011 SVI Assessment Report. Results of the SVI testing indicated no further action was warranted. Several rounds of sub-slab pressure readings were recorded to monitor the efficacy of the existing passive venting system installed. The testing demonstrated on several occasions that the building is positively pressurized and no further action was warranted.
- **1769 Emerson Street**– The building nearest the P-1 plume (northernmost) at this property was recommended for SVI (sub-slab/indoor air) testing based on the 2011 SVI Assessment Report. The results of the SVI testing indicated no further action was warranted.
- **1770 Emerson Street**– The automotive repair building at this property was recommended for SVI (sub-slab/indoor air) testing based on the 2011 SVI Assessment Report. The results of the SVI testing when compared to the NYSDOH Decision Matrices at the time of sampling (October 2006 with updates in 2013 and 2015) indicated the owner should take reasonable and practical actions to identify source(s) and reduce exposures. Subsequently, VOC containing containers were removed from the areas requiring action, and the indoor air was resampled. The results indicated no further action was warranted.
- **500 Lee Road**– The Powerhouse building (southernmost building) at this property was recommended for soil gas sampling based on the 2011 SVI Assessment Report due the floor slab’s significant depth below grade, the lack of regular occupancy of the building’s basement, and the use of the building. A sample from the basement sump was also collected. The results of soil gas vapor and sump sampling indicated no further action was warranted.
- **575 Colfax Street**– The building at this property was recommended for SVI (sub-slab/indoor air) testing and mitigation based on the 2011 SVI Assessment Report and due to elevated methane readings during the Site reconnaissance. Due to the use of a large portion of the building as a bus maintenance facility, SVI testing was completed in office spaces. The results of the SVI testing confirmed that mitigation was warranted. It should be noted SVI was likely attributed to leaks in drains throughout the bus repair portion of the building. The preexisting passive venting system was activated and follow-up indoor air sampling was completed in 2018 which proved the system is effective in reducing CVOCs in indoor air.
- **1740 Emerson Street**– The building at this property was recommended for SVI (sub-slab/indoor air) testing and mitigation based on the 2011 SVI Assessment Report. The results of the SVI testing confirmed mitigation was warranted. A retro-fitted SSDS was

installed and follow-up indoor air sampling was completed in 2018 which proved the system is effective in reducing CVOCs in indoor air.

Based on the assessments conducted, mitigation was warranted at two (2) of the seven (7) buildings tested; 575 Colfax Street and 1740 Emerson Street. It should be noted that based on a floor drain evaluation conducted in the bus repair portion of the 575 Colfax Street building which identified the ability for chemicals associated with bus repair to be released to the sub-slab, the presence of SVI at 575 Colfax Street does not appear to be caused by the FESL but rather on-site operations which have included bus repair since the early 1980s. Details of the mitigation systems installed are included in a Construction Completion Report (CCR) for each respective property (draft CCRs dated September 2018). No further action associated with FESL-related SVI is warranted at this time.

3.2 Remedial Investigations

Several investigations have been conducted since the 1980s at the FESL including those described in the following pertinent reports:

- Remedial Investigation Report- P-1 Plume Former Emerson Street Landfill by LaBella and GEI Consultants dated June 2018 (*note this report has not yet been approved by NYSDEC*).
- Former Emerson Street Landfill Remedial Investigation Report for City of Rochester Parcels 4, 10, and 11, by LaBella and Geomatrix Consultants dated November 2001
- Former Emerson Street Landfill Modified Remedial Investigation Report, by Haley & Aldrich of NY, dated January 1994
- Phase II Investigation, by RECRA Environmental Inc. dated February 1990

The P-1 Plume is the only plume known to be associated with the FESL. The inferred CVOC plumes and monitoring well locations are included on Figure 3. The 2011 SVI Assessment Report should be referenced for details regarding the 2010-2011 groundwater sampling. A summary of the P-1 plume is included below:

1700 Emerson Street (P-1 Plume)

The P-1 Plume is located at 1700 Emerson Street (formerly 1655 Lexington Avenue) and travels south-southeast towards the storm sewer installed in blasted bedrock beneath McCrackanville Street. Based on previous knowledge of the FESL and known concentrations of CVOCs in the vicinity of the P-1 plume, it has been determined that the P-1 plume is the only plume that may have been caused by a FESL-related release of contaminants. Prior to closure of the landfill in 1971, the incinerators were not operating properly. At this time, filling was taking place only in the northwest portion (Quadrant A; refer to Section 2 and Figure 3) of the FESL, specifically, at 1700 Emerson Street. Filling in the locations of 535 Colfax Street and 1425 Emerson Street had ended several years prior to 1971. This conclusion is confirmed by the 1971 aerial photograph which shows filling-related disturbances in the northwest portion of the landfill only.

The two (2) smaller CVOC plumes located near 535 Colfax Street and 1425 Emerson Street are believed to be attributed to current and/or previous uses of the properties and current and/or previous practices by building occupants after the redevelopment of the FESL. Refer to Figure 3 for locations of all three (3) plumes.

3.2.1 Summary of P-1 Plume Remedial Investigation 2012-2017

The recent RI consisted of installation of six (6) overburden, sixteen (16) shallow bedrock and two (2) deep bedrock groundwater monitoring wells, advancement of thirty-three (33) overburden soil borings, twenty-eight (28) test pits, twenty-one (21) membrane interface probe (MIP) borings, four (4) pump tests to evaluate hydraulic conductivity, downhole geophysics, and associated sampling of soil/ fill, overburden and bedrock groundwater, and bedrock.

The nature and extent of the P-1 Plume was defined during the RI and previous investigations conducted (refer to Figure 5). CVOCs in bedrock groundwater have most recently been detected up to 14,000 ppb in LAB-SBW-09 and are migrating downgradient to the southeast approximately 450 feet from the inferred source area. Biodegradation is occurring and parent compounds TCE and PCE are not migrating off-Site. Breakdown compounds cis-1,2-dichloroethene, vinyl chloride and chloroethane are present in downgradient monitoring well GMX-MW-3 at concentrations that exceed SCGs and total approximately 1.2 ppm. Other perimeter wells including GMX-MW-1 (southwest), GMX-MW-4 (northeast), LAB-SBW-01 (north), GMX-MW-6S and GMX-MW-6D (south) do not contain CVOCs at concentrations exceeding SCGs.

The estimated total mass of CVOCs in soil is 232 lbs, in groundwater is 13 lbs, and sorbed to bedrock is 1,724 lbs. Calculated porewater concentrations exceed the solubility limits for parent compounds PCE and TCE in the source area, which indicates DNAPL source material is suspected, even in the absence of visual confirmation. The significance of these findings relates to contaminant diffusion into the bedrock matrix and likely presence of DNAPL in tight, closed-ended fractures. Under these situations, back diffusion from the bedrock matrix to groundwater will pose a long-term source of groundwater contamination.

Off-Site human health exposures have been assessed via a SVI investigation and have been addressed via mitigation of impacted buildings (refer to Section 3.1). Institutional controls including the City's permit system which flags all properties on the FESL to prevent permit issuance without consideration for FESL-related concerns including fill material and potential for SVI, have also been effective in preventing exposure.

Refer to Section 5 for a more detailed description of the conceptual site model.

4. Geology & Hydrogeology

Geology and hydrogeology are based on the findings of previous investigations since the 1980s.

4.1 Geology

The overburden materials in the P-1 investigation area at the FESL consist predominantly of waste/fill materials placed during landfill operation. Based on historical and recent investigations the

- 8 -

waste/soil fill thickness across the P-1 Plume investigation area ranges between 23 and 27 feet in depth. The waste mass is generally unsaturated, however, few thin perched zones of saturated conditions are documented and the lowermost 1-2-ft of overburden may seasonally exhibit groundwater. A thin, discontinuous layer of native sand/silt which is typically overlain by a layer of peat ranges from a few inches to a maximum observed thickness of 4.3-ft.

Depth to bedrock ranges between approximately 23 and 27-ft below ground surface (bgs) at elevations ranging between approximately 519-522 feet above mean sea level (fmsl). The uppermost bedrock encountered at the FESL Site is the Penfield Member of the Lockport Group and consists of a fine-grained sequence of grey to dark grey argillaceous limestone and dolostone. Bedrock at the Site is subdivided into five zones characterized by fracture frequency and the presence of laterally extensive horizontally transmissive bedding plane fractures. The bedrock zones are characterized as follows:

A-Zone (generally >518 fmsl)- The A-Zone is comprised of the upper 3-ft of highly fractured and weathered top of bedrock and includes the lowermost portion of saturated overburden, where present. The average RQDs in this zone were 2%. Hydraulic communication was not observed with other wells during drilling in this zone.

Upper B-Zone (~512-518 fmsl)- The Upper B Zone spans the bedrock thickness between the A-Zone and B-Zone (3-8-ft btr) and does not exhibit laterally extensive fracturing, however fracture frequency from bedrock core (RQD) and televiewer information suggest a higher frequency of fracturing compared to deeper portions of the bedrock (D-Zone). The average RQDs in this zone were 13%. During drilling LAB-DBW-01 in this zone, hydraulic communication was observed at LAB-SBW-03. During drilling LAB-SBW-04 in this zone, hydraulic communication was observed at LAB-SBW-03 and LAB-SBW-05. During drilling LAB-SBW-07 in this zone, hydraulic communication was observed at LAB-SBW-06 and GMX-MW-4.

B-Zone (~508-512 fmsl)- The B-Zone groundwater flow system is present from an elevation of approximately 508 to 512 fmsl (8-16-ft btr) and is characterized by the first laterally extensive high transmissivity fracture zone identified in bedrock core, downhole televiewer observations, and direct evidence of hydraulic communication between wells observed during bedrock coring using air rotary methods. The average RQDs in this zone were 24%. During drilling LAB-SBW-08, LAB-DBW-01 and LAB-DBW-02 in this zone, hydraulic communication was observed at LAB-SBW-03. During drilling LAB-SBW-04 in this zone, hydraulic communication was observed at LAB-SBW-03 and LAB-SBW-05.

C-Zone (~494-508 fmsl)- The C-Zone flow system is characterized by the second laterally-extensive fracture system identified through bedrock core, televiewer and hydraulic communication data and is present from approximately 494 to 508 fmsl (16-25-ft btr). The average RQDs in this zone were 60%. During drilling LAB-DBW-02 in this zone, hydraulic communication was observed at GMX-MW-4, LAB-SBW-06, and LAB-SBW-07. During drilling LAB-SBW-05 and LAB-SBW-06 in this zone, hydraulic communication was observed at GMX-MW-4.

D-Zone (<494 fmsl)- The D-Zone flow system is the deepest flow regime investigated and is present within the Rochester Shale at depths deeper than approximately 494 fmsl (25-ft btr)

- 9 -

and below. The average RQDs in this zone were 81%. During drilling LAB-DBW-02 in this zone, hydraulic communication was observed at LAB-SBW-01, LAB-SBW-06, LAB-SBW-08 and GMX-MW-4.

4.2 Hydrogeology

There are two (2) separate groundwater zones, shallow bedrock (bedrock zones A-C) and deep bedrock (bedrock zone D). Wells in the deep bedrock zone include LAB-DBW-01, LAB-DBW-02 and GMX-MW6D. All remaining bedrock wells are in the shallow bedrock zone. The overburden is generally unsaturated.

Deep Bedrock Groundwater:

The groundwater elevation in GMX-MW-6D was observed to be approximately 7-feet higher than in LAB-DBW-01 and LAB-DBW-02 during the RI. The groundwater elevation in GMX-MW-6D was approximately 8-feet higher than the groundwater elevation in GMX-MW-6S during the RI. Due to only these three (3) monitoring wells being set within the D Zone and the fact that these wells are in relative linear alignment (i.e., triangulation is not feasible), deep bedrock groundwater flow direction across the Site was not determined. LAB-DBW-01 and LAB-DBW-02 are located near the source area and GMX-MW-6D is located near the southern property boundary.

Shallow Bedrock Groundwater:

A weak, generally north to south horizontal groundwater flow gradient (0.008) is present on-Site within shallow bedrock groundwater. Shallow bedrock groundwater flow in the area of the P-1 plume may be influenced by the storm sewer that parallels McCrackanville and Emerson Streets. The sewer is incised into the bedrock and is presumed to be surrounded by permeable backfill. Based on the invert elevations of the storm sewer (approximately 517-518 fmsl), groundwater typically discharges to the backfill creating a localized groundwater low parallel with McCrackanville and Emerson Streets. During the May 2017 water level monitoring event, a groundwater high was observed to exist paralleling the sewer. The May 2017 water level monitoring event occurred after an extended period of wet weather and groundwater transmitted from the north to the south is suspected of causing the observed flow pattern away from the sewer (i.e., slightly towards the west).

An average hydraulic conductivity value of approximately 400 ft/day (1.4×10^{-1} cm/S) was calculated from the pumping tests completed during the recent RI. An average linear flow velocity (groundwater seepage velocity) was calculated to be 3.2 ft/day (1.1×10^{-3} cm/S) using data from bedrock monitoring wells which span the B and C bedrock flow zones.

A weakly downward hydraulic gradient is present at paired well locations near the P-1 source area (LAB-DBW-02 519.28 fmsl and LAB-SBW-05 519.39 fmsl). Farther down gradient at the GMX-MW-6S/6D well pair, the vertical hydraulic gradient is measured to be strongly upward (GMX-MW-6D 526.95 fmsl and GMX-MW-6S 519.56 fmsl). The low hydraulic conductivity of the shallow and deeper bedrock at this location suggests this area has low hydraulic communication with other areas of the P-1 plume.

5. Summary of RI and Exposure Assessment

5.1 Nature and Extent of Contamination

The RI has defined the source area of CVOCs as shown on Figure 4. The plume of CVOCs with concentrations above NYSDEC Groundwater Quality Standards is shown on Figure 5. The greatest concentrations of CVOCs in groundwater to date have been detected in the top 3-ft of bedrock groundwater. Specifically, monitoring wells LAB-DBW-02, LAB-SBW-05, LAB-SBW-09, and P-1 all contained greater than 15 ppm total CVOCs in at least one sampling event. The top 3-ft of bedrock also contains the highest concentrations of CVOCs in the rock matrix within the source area. Concentrations of CVOCs in bedrock and bedrock groundwater generally decrease with depth within the source area.

Groundwater: The source area of CVOCs in groundwater (encompassed by 2013-SB-01, LAB-OBW-01, 2016-SB-19, 2016-SB-20, LAB-DBW-01, LAB-SBW-02, LAB-SBW-09 and LAB-SBW-10) is approximately 16,000 sq. ft. Based on the reduction of CVOCs from 2000 to 2017 including an 83% decrease in total CVOCs in the P-1 well from 54.4 ppm to 8.9 ppm, and a 77% decrease in total CVOCs in GMX-MW-3 (downgradient) from 5.3 ppm to 1.2 ppm, natural attenuation of the plume is occurring.

Soil Vapor: A FESL-wide SVI assessment was conducted from 2009-2017 documented in the 2011 SVI Assessment Report dated June 2011 and Draft SVI Investigation Report dated March 2018 and identified only one (1) building with impacted soil vapor from a FESL-related source. The south adjacent building to the Site (1740 Emerson Street) has been mitigated to prevent SVI related to the FESL. Institutional controls also prevent newly constructed buildings designed for regular occupancy to be occupied without being assessed or mitigated for SVI.

Soil/ Fill: Unincinerated fill material is generally present in the source area beginning at depths ranging from 2-8-ft bgs, with ash present at greater depths. Total CVOCs have been detected in soil/fill at concentrations up to 766 ppm in LAB-OBW-01 at 23-24-ft bgs and total BTEX has been detected in soil/ fill at concentrations up to 3,040 ppm in 2016-SB-20 at 18-19-ft bgs. The greatest concentrations of CVOCs are present directly above bedrock, generally at depths greater than 20-ft bgs in an approximate 8,000 sq. ft. area (approximately 1,800 cubic yards).

Bedrock: The uppermost 3-ft of bedrock contains the highest concentrations of CVOCs sorbed to the rock matrix in the source area. Concentrations of CVOCs generally decrease with depth in the source area. Concentrations of CVOCs in bedrock wells downgradient of the source area (i.e., LAB-SBW-15 and LAB-SBW-16) were non-detect in the A Zones but were detected in the Upper B/ B Zones. The concentrations of CVOCs in the A Zone bedrock matrix are suggestive of a DNAPL source in LAB-SBW-02, LAB-SBW-09, LAB-SBW-10, and LAB-DBW-01. Impacts in bedrock are assumed to be approximately 60,000 sq. ft. and vary in elevations across that area from the A Zone to the B Zone. An estimated 18,000 cubic yards of bedrock impacts are present in the source area.

A summary of the estimated distribution of contaminant mass is included in the following table and further detailed below.

Distribution of Contaminant Mass in P-1 Plume Study Area

Zone	Soil		Bedrock		Groundwater		Total Mass by Zone	
	Mass (lbs)	% of total Mass	Mass (lbs)	% of total Mass	Mass (lbs)	% of total Mass	Mass (lbs)	% of total Mass
Overburden/ Fill	232	11.78%	--	--	--	--	232	11.78%
Bedrock A Zone	--	--	1,233	62.62%	5	0.25%	1,238	62.87%
Bedrock B1 Zone	--	--	491	24.94%	3	0.15%	498	25.29%
Bedrock B Zone	--	--			4	0.20%		
Bedrock C Zone	--	--	0.10	--	1	0.05%	1	0.05%
Bedrock D Zone	--	--	<0.01	--	<0.01	0.01%	<0.01	0.01
Total Mass (lbs)	232	11.78%	1,724	87.56%	13	0.66%	1,969	100%

Notes:

Mass calculations estimated based on concentration contours developed using modeling software.

Assumptions:

Mass of bedrock = 165 lb/ ft³

Mass of soil = 100 lb/ ft³

Porosity of bedrock 10%

The estimated total mass of CVOCs in soil/ fill is 232 lbs (or 11.78% of total mass), groundwater is 13 lbs (or 0.66% of total mass), and bedrock is 1,724 lbs (or 87.56% of total mass). A majority of contaminant mass is in bedrock as opposed to the overburden native soil/ fill material. Calculated porewater concentrations exceed the solubility limits for parent compounds PCE and TCE in bedrock in several locations (LAB-DBW-01, LAB-SBW-02, LAB-SBW-05, LAB-SBW-09, and LAB-SBW-10), which indicates DNAPL source material is suspected, even in the absence of visual confirmation. The significance of these findings relates to contaminant diffusion into the bedrock matrix and the likely presence of DNAPL in tight, closed-ended fractures. Under these situations, back diffusion from the bedrock matrix to groundwater will pose a long-term source of groundwater contamination.

5.2 Overall Conceptual Site Model

The following presents the overall conceptual model for the Site. This conceptual Site model is based on the RI recently completed and previous investigations.

During the last years of filling at the FESL, it appears some non-municipal waste was placed in the landfill in the vicinity of P-1 and more specifically in the area encompassed by 2013-SB-01, LAB-OBW-01, 2016-SB-19, 2016-SB-20, LAB-DBW-01, LAB-SBW-02, LAB-SBW-09 and LAB-SBW-10. This is supported by a review of aerial photographs, test pits, high concentrations of impacts in the

overburden/ fill on top of bedrock, the presence of the greatest concentrations of CVOCs in A Zone groundwater, and bedrock matrix samples.

NAPL and/or high concentrations of VOC impacted groundwater has since migrated laterally and vertically from this source area. Based on rock matrix analysis, impacts migrated to the southeast to LAB-SBW-05 in the A Zone and Upper B Zone. Impacts (not NAPL) further migrated laterally to the west and southwest (LAB-SBW-13 and LAB-SBW-14) and to the south (LAB-SBW-15 and LAB-SBW-16) into the B Zone. This is evidenced by greater concentrations of CVOCs in the B Zone than in the A Zone in these locations. Impacts have not migrated at significant concentrations laterally to the southeast or vertically to the C or D Zones.

As the impacts have migrated downward vertically and laterally, natural degradation has been occurring. This is evidenced by greater concentrations of daughter compounds than parent compounds in bedrock groundwater. In addition the source edge bedrock samples have a higher proportion of daughter compounds than the samples in the source area. Furthermore, the overall P-1 Plume area has decreased since 2000 and concentrations of total CVOCs have declined. Refer to Figure 3 for extent of the P-1 Plume. The source area of CVOCs in groundwater (encompassed by 2013-SB-01, LAB-OBW-01, 2016-SB-19, 2016-SB-20, LAB-DBW-01, LAB-SBW-02, LAB-SBW-09 and LAB-SBW-10) is approximately 16,000 sq. ft. as shown on Figure 5.

In accordance with the EPA Technical Protocol Table 2.4 evaluation that was performed as part of the RI, there is *“Adequate Evidence for anaerobic biodegradation (reductive dechlorination) of chlorinated organics”*. Additionally, compound-specific isotope analysis (CSIA) results indicate natural transformation of parent material (PCE and TCE) to daughter products is occurring. The mechanism for transformation was evaluated using Bio-Trap samplers. Analytical results indicate the presence of DHC (Dehalococcoides) and DHBt (Dehalobacter) in population ranges capable of natural biodegradation of CVOCs in the P-1 study area; however, biodegradation appears to be incomplete prior to regulated contaminants leaving the property boundary. This is supported by the fact that chloroethane, cis-1,2-dichloroethene, and vinyl chloride are detected in the downgradient wells. Specifically, chloroethane (145 ppb), cis-1,2-dichloroethene (751 ppb), and vinyl chloride (305 ppb) are detected in GMX-MW-3 downgradient of the source area proximate to the eastern property boundary in May 2017, and parent compounds were not detected.

5.3 Exposure Assessment

On-Site and off-Site exposure assessments were completed in the RI. Based on the on-Site exposure assessment, only on-Site workers have the potential to come in contact with contaminated media. On-Site workers are required to be 40-hour OSHA HAZWOPER trained and work in accordance with a health and safety plan. The Site is currently vacant land. Any future on-Site development would be managed in accordance with the *Waste Fill Management during Site Development Guidance Document*. In addition, an Institutional Control is in place which prohibits permit issuance on the FESL in the City’s Building Information System without City Division of Environmental Quality review. The use of groundwater in the City is prohibited by City code. A completed on-Site exposure pathway does not exist for contaminated media as long as subsurface disturbances are properly managed.

Off-Site human health exposures have been assessed via an extensive SVI investigation and mitigation of impacted buildings. A complete off-Site exposure pathway does not currently exist as

long as institutional controls remain in place and the mitigation system installed at 1740 Emerson Street remains in operation. The *Waste Fill Management during Site Development Guidance Document* will be implemented during subsurface work on the FESL and the *FESL Sub-Slab Ventilation Guidance Document* will be implemented during future construction of buildings on the FESL. The City controls the Site and FESL by flagging all FESL properties in the City Building Information System. The use of groundwater in the City is prohibited by City code.

6. Standards, Criteria and Guidelines

This section identifies the Standards, Criteria and Guidelines (SCGs) for the Site.

Soil SCGs: The following SCGs for soil are applicable for the Site:

- New York Codes, Rules, and Regulations (NYCRR) Subpart 375-6 Remedial Program Soil Cleanup Objectives (RPSCOs) for the Protection of Groundwater;
- NYCRR Subpart 375-6 RPSCOs for Industrial Use.

Groundwater SCGs: The following SCGs for groundwater are applicable for the Site:

- NYSDEC Part 703 Groundwater Standards;
- Technical and Operational Guidance Series (TOGS) 1.1.1 Ambient Water Quality Standards and Guidance Values.

Soil Gas SCGs: Currently, no state regulatory (NYSDEC or NYSDOH) guidance values exist for soil gas.

Bedrock: Currently, no state regulatory (NYSDEC or NYSDOH) guidance values exist for bedrock.

7. Remedial Action Objectives

The primary Remedial Action Objectives (RAOs) are as follows:

Groundwater RAOs:

- a. Prevent ingestion of groundwater with contaminant levels exceeding drinking water standards;
- b. Prevent contact with, or inhalation of volatiles, from contaminated groundwater; and
- c. Prevent off-Site migration of contaminants in groundwater at levels exceeding drinking water standards.

Soil RAOs:

- a. Prevent ingestion/ direct contact with contaminated soil;
- b. Prevent inhalation of or exposure from contaminants volatilizing from contaminants in soil; and
- c. Prevent migration of contaminants that would result in groundwater or surface water contamination.

Soil Vapor RAOs

- a. Mitigate impacts to public health resulting from existing, or the potential for, soil vapor intrusion into buildings at a site.

8. Preliminary Screening of Alternatives

The following alternatives were initially screened for implementation at the Site. Several options were ruled out and others were selected for further evaluation.

Initial Screening of Remedial Alternatives

General Remedial Scenario	Remedial Technology	Selected for Further Evaluation	Explanation
No action	None	No	No action will not meet any of the criteria.
In-Situ Biological Treatment	Enhanced Bioremediation	No	Microorganisms are present and biological treatment is occurring.
	Bioventing	No	Microorganisms are present and biological treatment is occurring.
	Monitored Natural Attenuation	Yes	Natural attenuation of CVOCs in groundwater is occurring.
In-Situ Chemical/ Physical Treatment	Chemical Oxidation	No	Due to high chemical oxidant demand of bedrock matrix, chemical oxidation is not feasible.
	Chemical Reduction	Yes	Potential source treatment and permeable reactive barrier
	Thermal Treatment	Yes	Potential source treatment
	Dual Phase Extraction	Yes	Treat contaminated groundwater and soil vapor.
Ex-Situ Chemical/ Physical Treatment	Excavation	Yes	Source removal option.
	Pump and Treat	Yes	Treat contaminated groundwater on-Site.
	Bioreactor	No	Large volume of contaminated media.
Containment	Grout Wall	No	Groundwater gradient is not steep. Large aerial extent of plume.
	Cap/ Cover	Yes	Limit exposure to subsurface contaminants.

9. Description of Selected Alternatives

Alternatives retained for a detailed evaluation are presented in this section. As shown by the Conceptual Site Model, a point source of CVOCs has not been identified at the Site; however, the inferred source area is defined as the area encompassed by 2013-SB-01, LAB-OBW-01, 2016-SB-19, 2016-SB-20, LAB-DBW-01, LAB-SBW-02, LAB-SBW-09 and LAB-SBW-10 which includes source material in the overburden soil/ fill and the A Zone (approximately 16,000 sq. ft.). Source material is present in lower bedrock zones (Upper B and B Zones) outside of this area further south due to migration of CVOCs in bedrock vertically and horizontally with groundwater flow (north to south). Source material in overburden/ fill, the A Zone, Upper B Zone, and B Zone accounts for 88% of the total mass of CVOCs at the Site. Locations with source material in the overburden and bedrock are outlined on Figure 4. The source area does not encompass all impacts exceeding Unrestricted Use SCOs. A cover system, ECs and ICs are part of each alternative below and further described in Section 13.

- A) Excavation:** This technology would involve excavation of the overburden and top several feet of bedrock within the source area. An approximate 100,000 square foot (sq ft) area would be excavated to remove impacts above Unrestricted Use SCOs. It is assumed that the top 2-feet of material would be reused as backfill. Material from 2-ft bgs to bedrock (beginning at approximately 23-25-ft bgs) and up to 5-feet of bedrock would be excavated. An estimated 100,000 cubic yards (CY) (i.e., 185,000 tons) of material would be disposed of off-Site based on TCLP results. It is assumed soil/ fill 2-ft above top of bedrock, and the top 3-ft of bedrock will be characterized as hazardous (35,000 tons). It is assumed the remaining material will be characterized as non-hazardous (150,000 tons). Excavations would be dewatered and water would be stored temporarily in frac tanks prior to sampling and treatment via carbon, and discharged to the sanitary sewer via a permit through Monroe County Pure Waters. Shoring would be required to support the excavation walls and excavations would be benched to reach the desired depths. Sidewall confirmatory samples would be collected for analysis of VOCs, SVOCs, metals, cyanide, pesticides, and PCBs. Due to the large scale of the excavation, it is assumed a reduced frequency of less than 1 sample per 30-ft of excavation perimeter would be implemented. The excavation would extend to bedrock; as such, bottom confirmatory soil samples will not be collected. Bedrock samples would be collected for documentation purposes. An amendment would be placed in the backfill to promote further biodegradation. Imported backfill would consist of crushed recycled concrete/ crushed stone/ and or other material that meets Unrestricted Use SCOs. This alternative would also include placing an amendment in the backfill.

This option will require a cover system be constructed to ensure the top 1-ft of the Site meets Industrial Use SCOs. Refer to Section 13.2 for cover details.

This alternative assumes quarterly post-remedial groundwater monitoring for 2 years, semi-annual monitoring for an additional 3 years, and annual monitoring for an additional 25 years (30 years total). Up to 12 wells would be sampled for TCL VOCs via passive diffusion bags (PDBs). It should be noted that although this alternative would meet Unrestricted Use SCOs within the excavation area, the areas outside the excavation would still contain landfill

materials (ash, cinders and some unincinerated putrescible waste); as such, Site controls would still be necessary.

The cost to implement this alternative is approximately \$24.5 million with 30 year operation and maintenance costs including periodic review reports, annual inspections, and groundwater monitoring, totaling approximately \$208,000. Refer to Figure 7 for a representation of this alternative and Table A for a cost analysis.

B) Electrical Resistance Heating (ERH)- This alternative would consist of installing a series of electrodes through the overburden/ fill and into bedrock and heating the wells to the boiling point of the contaminants to vaporize CVOCs. Vapor recovery wells would be installed to collect vapors that would be treated in an on-Site treatment system using activated carbon or other treatment methods. An approximate 23,000 sq ft area would be treated which includes the inferred source area and additional wells surrounding the source area to minimize back diffusion following treatment. Electrodes would extend through the overburden to approximately 15-ft btr. Temperature would be continuously monitored and mass reduction would be determined throughout the treatment period to determine when treatment goals have been met. Necessary utilities including sewer and electric would be brought to the Site.

This option will require a cover system be constructed to ensure the top 1-ft of the Site meets Industrial Use SCOs. Refer to Section 13.2 for cover details.

This alternative assumes quarterly post-remedial groundwater monitoring for 2 years, semi-annual monitoring for an additional 3 years, and annual monitoring for an additional 25 years (30 years total). Up to 12 wells would be sampled for TCL VOCs via PDBs.

The cost to implement this alternative is approximately \$5.6 million with 30 year operation and maintenance costs including periodic review reports, annual inspections, and groundwater monitoring, totaling approximately \$208,000. Refer to Figure 8 for a representation of this alternative and Table B for a cost analysis.

C) Groundwater Extraction and Ex-Situ Treatment System- This technology would consist of a pump and treat or dual phase extraction system that would continuously pump groundwater to an on-Site treatment system and treat the contaminated groundwater via activated carbon, air strippers, etc. This approach would rely on long-term hydraulic containment of the plume. Back diffusion would continue to occur and pose a continuing source of CVOCs to groundwater. A treatment system building would be constructed and the necessary utilities would be installed at the Site (e.g., electric, sewer, communication, etc.). It is assumed that up to 6 pumping wells would be installed to depths up to 10-ft btr. This analysis includes operation and maintenance of the system for 30 years; however, it is assumed the system would run indefinitely.

This option will require a cover system be constructed to ensure the top 1-ft of the Site meets Industrial Use SCOs. Refer to Section 13.2 for cover details.

This alternative assumes quarterly post-remedial groundwater monitoring for 5 years and semi-annual sampling for an additional 25 years (30 years total). Up to 12 wells would be sampled for TCL VOCs via PDBs.

The cost to implement this alternative is approximately \$3 million with 30 year operation and maintenance costs including monthly discharge sampling, periodic system checks and maintenance, equipment repairs as needed, periodic review reports, annual inspections, and groundwater monitoring, totaling approximately \$1.5 million. Refer to Figure 9 for a representation of this alternative and Table C for a cost analysis.

D) In-Situ Source Treatment with Permeable Reactive Barrier- This technology would involve injection of a reducing agent (e.g., zero valent iron and carbon source) into the overburden and top of bedrock within the inferred source area and downgradient of the source area to reduce concentrations of CVOCs in both the source area and downgradient to prevent off-Site migration. Hydraulic injections would be completed in the source area via injection wells installed to depths up to 8-ft btr (A and Upper B Zone). Injection wells may be installed at varying depths to target specific depth intervals (i.e., deeper injection intervals extending to the Upper B Zone on the southernmost injection points). It is assumed the treatment chemical would be injected starting at 5-feet above bedrock and extending to depths up to 8-ft btr in the area with source material impacts in bedrock greater than 40 ppm total CVOCs (approximately 26,000 square feet). A total of 350,000 lbs ZVI (or similar) would be injected via hydraulic injection methods to 118 injection wells (approximate 15-ft spacing) in the source area. The mass of ZVI estimated assumes a 1% dosing of the soil/ bedrock mass. Microbes (DHC inoculum, or similar) would also be injected in the source area to promote biodegradation of source material.

In addition, a PRB would be installed perpendicular to groundwater flow downgradient (i.e., south) of the source area via a blast-enhanced bedrock trench or pneumatic injections. Two (2) injection methods, blast-enhanced bedrock trench and pneumatic injections, are being considered. Each method is summarized below:

- For the blast-enhanced bedrock trench method, approximately 75 blast points would be spaced approximately 5-ft apart to form a PRB 375-ft in length. Injection wells would be installed every 50-ft (8 wells total) within the trench after blasting. Blast points and injection wells would be installed to depths up to 16-ft btr (encompassing the A, Upper B and B Zones). A total of 350,000 lbs of ZVI (or similar) would be injected into the trench via hydraulic injection methods which assumes 10% dosing of the bedrock mass. Work plans would include a blast plan with seismic monitoring to monitor any movement in the surrounding area as a result of the blasting.
- For the pneumatic injection method, two (2) off-set rows of pneumatic injection points (one row of 13 and one row of 5) would be installed at 30-ft horizontal spacing (15-ft radius of influence) to depths up to 16-ft btr (encompassing the A, Upper B and B Zones). A total of 285,000 lbs ZVI (or similar) would be injected via pneumatic techniques, which assumes a 1% dosing of the bedrock mass.

- 18 -

This option will require a cover system be constructed to ensure the top 1-ft of the Site meets Industrial Use SCOs. Refer to Section 13.2 for cover details.

Up to four (4) bedrock monitoring wells would be installed downgradient of the PRB for post-remedial monitoring. The PRB would be replenished with ZVI (or similar) every 10 years via hydraulic injections. It should be noted that reinjection into the PRB area may present some complications at that time and additional injection wells adjacent to the previously installed PRB may be necessary. Costs for installation of an additional three (3) injection wells every 10 years are included. This alternative assumes quarterly post-remedial groundwater monitoring for 1 year, semi-annual monitoring for 2 additional years, and annual monitoring for an additional 27 years (30 years total). Up to 12 wells would be sampled for TCL VOCs and MNA parameters via low-flow techniques.

The cost to implement this alternative is approximately \$4.9 million for the blasted bedrock trench alternative and \$5.1 million for the pneumatic injection alternative, with 30 year operation and maintenance costs including periodic review reports, annual inspections, and groundwater monitoring, totaling approximately \$1.8 million for the blasted bedrock trench alternative and \$2.0 million for the pneumatic injection alternative. Operation and maintenance includes ZVI injections during years 10, 20 and 30. Refer to Figures 10A and 10B for representations of this alternative and Tables D1 and D2 for a cost analysis.

E) Permeable Reactive Barrier (PRB) with Monitored Natural Attenuation (MNA)- This technology would involve injection of a reducing agent (e.g., zero valent iron, etc.) on the downgradient edge of the plume to form a PRB that will reduce CVOCs in groundwater into less harmful breakdown products and prevent off-Site migration of CVOCs. As determined during the RI, in accordance with the EPA Technical Protocol Table 2.4 evaluation performed during the recent RI, there is “*Adequate Evidence for anaerobic biodegradation (reductive dechlorination) of chlorinated organics*”. Additionally, CSIA results indicate natural transformation of parent material (PCE and TCE) to daughter products is occurring. Biodegradation appears to be incomplete prior to regulated contaminants leaving the property boundary. This is supported by the fact that chloroethane, cis-1,2-dichloroethene, and vinyl chloride are detected in the downgradient wells (GMX-MW-3, LAB-SBW-15 and LAB-SBW-16). The PRB would help to further reduce CVOCs migrating towards the property boundary. The PRB would be installed perpendicular to groundwater flow downgradient (i.e., south) of the source area via a blast-enhanced bedrock trench or pneumatic injections.

Two (2) injection methods, blast-enhanced bedrock trench and pneumatic injections, are being considered. Each method is summarized below:

- For the blast-enhanced bedrock trench method, approximately 75 blast points would be spaced approximately 5-ft apart to form a PRB 375-ft in length. Injection wells would be installed every 50-ft (8 wells total) within the trench after blasting. Blast points and injection wells would be installed to depths up to 16-ft btr (encompassing the A, Upper B and B Zones). A total of 350,000 lbs of ZVI (or similar) would be

- 19 -

injected into the trench via hydraulic injection methods which assumes 10% dosing of the bedrock mass. Work plans would include a blast plan with seismic monitoring to monitor any movement in the surrounding area as a result of the blasting.

- For the pneumatic injection method, two (2) off-set rows of pneumatic injection points (one row of 13 and one row of 5) would be installed at 30-ft horizontal spacing (15ft radius of influence) to depths up to 16-ft btr (encompassing the A, Upper B and B Zones). A total of 285,000 lbs ZVI (or similar) would be injected via pneumatic techniques, which assumes a 1% dosing of the bedrock mass.

This option will require a cover system be constructed to ensure the top 1-ft of the Site meets Industrial Use SCOs. Refer to Section 13.2 for cover details.

Up to four (4) bedrock monitoring wells would be installed downgradient of the PRB for post-remedial monitoring. The PRB would be replenished with ZVI (or similar) every 10 years, or as deemed warranted based on long-term groundwater monitoring, via hydraulic injections within existing injection wells. It should be noted that reinjection into the PRB area may present some complications at that time and additional injection wells adjacent to the previously installed PRB may be necessary. Costs for installation of an additional three (3) injection wells every 10 years are included. This alternative assumes quarterly post-remedial groundwater monitoring for 1 years, semi-annual monitoring for 2 additional years, and annual monitoring for an additional 27 years (30 years total). Up to 12 wells would be sampled for TCL VOCs and MNA parameters via low-flow techniques.

The cost to implement this alternative is approximately \$1.6 million for the blasted bedrock trench alternative and \$2.1 million for the pneumatic injection alternative with 30 year operation and maintenance costs including periodic review reports, annual inspections, and groundwater monitoring, totaling approximately \$1.8 million for the blasted bedrock trench alternative and \$3.0 million for the pneumatic injection alternative. Operation and maintenance includes ZVI injections during years 10, 20 and 30. Refer to Figures 11A and 11B for representations of this alternative and Table E1 and E2 for a cost analysis.

F) Monitored Natural Attenuation (MNA)- This technology would consist of long-term groundwater sampling to monitor the presence of CVOCs and breakdown compounds on-Site and in particular down-gradient of the source to demonstrate that CVOCs are naturally degrading. Based on biological testing completed to date, the presence of substantially more breakdown compounds than parent compounds on the downgradient edge of the plume, the MNA evaluation conducted during the RI and presented in the RI Report, MNA is occurring.

This option will require a cover system be constructed to ensure the top 1-ft of the Site meets Industrial Use SCOs. Refer to Section 13.2 for cover details.

It is assumed up to four (4) additional bedrock wells would be installed downgradient of the source area. This alternative assumes quarterly post-remedial groundwater monitoring for 5 years, semi-annual monitoring for 5 additional years, and annual monitoring for an additional

20 years (30 years total). Up to 12 wells would be sampled for TCL VOCs and MNA parameters via low-flow techniques.

The cost to implement this alternative is approximately \$1.1 million with 30 year operation and maintenance costs including periodic review reports, annual inspections, and groundwater monitoring, totaling approximately \$463,000. Refer to Figure 12 for a representation of this alternative and Table F for a cost analysis.

Institutional controls and engineering controls will be required in conjunction with the alternatives listed above. These ICs and ECs for the recommended alternative are detailed in Section 13. The cover system included in alternatives A through F is considered an EC and will be applied regardless of the remedial alternative selected; as such, it is evaluated separately from the alternatives listed above.

10. Evaluation Criteria

Technologies were initially evaluated based on criteria in accordance with NYSDEC DER-10 (Section 4.0) and DER-31. Remedial alternatives were evaluated based on the following criteria:

- 1) Overall Protection of Public Health and the Environment: This criterion evaluates the ability of each remedial alternative to protect public health and the environment during or subsequent to implementation of the alternative.
- 2) Compliance with SCGs: This criterion evaluates whether each remedial alternative will ultimately result in compliance with the applicable, relevant or appropriate SCGs, to the extent practicable.
- 3) Long-Term Effectiveness and Permanence: This criterion evaluates if each remedial alternative is effective and permanent in the long-term after implementation (e.g., potential rebound of groundwater contamination). In the event that residual impacts will remain as part of the alternative, then the risks and adequacy/reliability of the controls are also evaluated.
- 4) Reduction of Toxicity, Mobility, or Volume with Treatment: This criterion evaluates the ability of each remedial alternative to reduce the toxicity, mobility and volume of site contamination. In addition, the reversibility of the contaminant destruction or treatment is evaluated.
- 5) Short-Term Impact and Effectiveness: This criterion evaluates the potential short-term adverse environmental impacts and human exposures during construction and/or implementation of an alternative or remedy.
- 6) Implementability: This criterion evaluates each remedial alternative based on its suitability, implementability at the specific site, and availability of services and materials that will be required.

- 7) Cost: This criterion evaluates the capital, operation, maintenance, and monitoring costs for each remedial alternative. The estimated costs are presented on a present worth basis.
- 8) Land Use: This criterion evaluates if the current, intended and reasonably anticipated future use of the Site and its surroundings, as it relates to an alternative or remedy, when unrestricted levels would not be achieved.
- 9) Community Acceptance: This criterion will be evaluated after the public review of the remedy selection process.
- 10) Green Remediation: This criterion considers all environmental effects of remedy implementation and incorporates alternatives that minimize the environmental footprint of cleanup actions.

11. Evaluation of Selected Alternatives

This section provides an evaluation of alternatives using the evaluation criteria listed in Section 10. Cost analyses are summarized below and further detailed on Table A through Table F, attached. A public comment period will be implemented for the selected remedy; as such, the community will provide input on the final remedy at a later date and community acceptance is not evaluated herein. ICs are currently in place for the Site and would remain in place for all alternatives evaluated. SVI has been addressed at the FESL and ICs and ECs relating to SVI will remain in place. In addition, an EC in the form of a cover system is included in each alternative due to the P-1 Plume and the landfilling materials that will remain under each alternative. ICs and ECs are further detailed in Section 13.

11.1 Excavation:

Overall Protection of Public Health and the Environment:

The excavation alternative may not be protective to human health and the environment because contaminated fill/ soil, groundwater, bedrock and soil vapor would be excavated and thus create a significant disturbance. In addition, to access the CVOCs, approximately 20-ft of landfill material would have to be excavated. The landfill materials may present unknown hazards for Site workers. Risks to workers and the public can be reduced by implementing dust and VOC monitoring and suppression techniques. Risks can be reduced for workers by implementing the appropriate level of personal protective equipment (PPE). Additional Site security would be required to prevent access to the Site to non-Site workers. This alternative contributes a significant volume (100,000 CY or 185,000 tons) of impacted material to landfills, resulting in 9,250 truck trips which is not fully protective to the environment.

Compliance with SCGs:

The excavation alternative would comply with SCGs in soil as it would cleanup soil/ fill to unrestricted use. CVOCs in deeper bedrock will remain and be a continued source of CVOCs in groundwater.

Long-Term Effectiveness and Permanence:

- 22 -

The excavation alternative would not be effective in the long-term as deeper bedrock would remain a continued source of CVOCs in groundwater.

Short-Term Impact and Effectiveness:

In the short-term, the excavation alternative would impact the surrounding area and would result in nuisance conditions for the surrounding community due to potential odors and/or dust and increased truck traffic. Furthermore, unknowns in the landfill could complicate the excavation work and may lead to short term impacts.

Reduction of Toxicity, Mobility, or Volume with Treatment:

Toxicity, mobility, and volume of contaminants would be reduced because the source of contaminants would be removed and disposed of off-Site. Mobility of contaminated groundwater would reduce during excavation activities while dewatering is occurring and; removing the source would prevent contaminants from contributing to groundwater overtime.

Implementability:

The excavation alternative would be very difficult to implement due to the depth (up to 30 feet) and area (up to 100,000 sq ft) of the excavation. Shoring would be required to support the excavation walls. Advanced odor suppression techniques would be required and landfill gas would be monitored for worker safety. This alternative would be difficult to safely and effectively implement.

Cost:

The excavation alternative would be very costly to implement. The estimated cost to implement this alternative is \$24.5 million with a 30 year operation and maintenance cost of \$208,000.

Land Use:

The excavation alternative would be consistent with land use which is industrial.

Green Remediation:

The excavation alternative would not be green due to the volume of impacted material that would contribute to landfills (100,000 CY), due to increased truck traffic (over 9,250 truck trips), and due to the large amount of fossil fuel needed to operate the required heavy equipment.

11.2 ERH

Overall Protection of Public Health and the Environment:

The ERH alternative would be protective to public health and the environment because the source area would be treated in-situ. An on-Site treatment system would be constructed to treat extracted contaminated soil vapors. There would be no increase in odors or dust to the surrounding public. There is some increased potential exposure to contaminated materials by on-Site workers during drilling and/or handling contaminated water/ soil vapor removed by the treatment system.

Compliance with SCGs:

The ERH alternative would comply with SCGs as it would permanently remove contaminants in soil/ fill, bedrock and groundwater within the treatment area to the desired treatment goal. By removing source material, CVOCs in groundwater outside of the treatment area would be reduced in the long term. The ERH alternative would treat an area encompassing the inferred source area but would not

treat all areas of impacts nor would it meet unrestricted use. ERH would not address CVOCs sorbed to rock outside of the treatment area.

Long-Term Effectiveness and Permanence:

The ERH alternative would be effective in the long-term as it would permanently reduce concentrations in the source material including bedrock; however, back diffusion may occur from outside the treatment area after ERH implementation. In the long-term, concentrations of contaminants in groundwater would decline. This alternative would be permanent as the contaminants within the source area would be permanently destroyed; however, as previously mentioned back diffusion is possible from outside of the treatment area.

Short-Term Impact and Effectiveness:

In the short-term, the ERH alternative would not significantly impact the surrounding area. There would be some increased truck traffic as equipment is delivered to the Site and utility connections are completed. The ERH treatment would be effective in reducing contaminant concentrations within a relatively short duration (3 to 6 months) after startup.

Reduction of Toxicity, Mobility, or Volume with Treatment:

Toxicity, mobility, and volume of contaminants will be reduced because contaminants in the source area would be destroyed. Mobility of contaminated groundwater would not be immediately reduced; however, destruction of source area contaminants would reduce the impacts to groundwater overtime. The mobility of contaminants would have to be monitored during the initial startup of the system to confirm that CVOCs are not mobilized prior to achieving the boiling point of CVOCs. ERH would not address CVOCs sorbed to rock outside of the treatment area. In addition, ERH may result in heating of waste mass and igniting of landfill methane gas.

Implementability:

The ERH alternative would be moderately difficult to implement. Utilities including electric and sewer would need to be brought on-Site as there are currently no utilities at the Site.

Cost:

The ERH alternative is relatively costly to implement. The estimated cost to implement this alternative is \$5.6 million with a 30 year operation and maintenance cost of \$208,000.

Land Use:

The ERH alternative would be consistent with land use which is industrial.

Green Remediation:

The ERH alternative would be green in that truck traffic and waste would be limited. There would be spoils associated with electrode/ well installation but this is minimal compared to the excavation approach. The approach would consume significant electricity.

11.3 Groundwater Extraction and Ex-Situ Treatment System

Overall Protection of Public Health and the Environment:

The groundwater extraction and ex-situ treatment system would be protective to public health and the environment because there would be no exposure to contaminated soil/ fill or bedrock to the

public. An on-Site treatment system would be constructed to treat extracted contaminated groundwater. The treatment system would be secure to prevent access by the public. This alternative would result in hydraulic control of the plume and prevent off-Site migration that may pose a threat to human health or the environment off-Site. There would be no increase in odors or dust to the surrounding public. There is some increased potential exposure to contaminated materials by on-Site workers during drilling and/or handling contaminated water/ soil vapor within the treatment system.

Compliance with SCGs:

The groundwater extraction and ex-situ treatment system would not comply with SCGs in the short term as impacted soil/ fill above Industrial Use SCOs would not be removed. Groundwater within the treatment area would be treated to meet SCGs; however, back diffusion of CVOCs sorbed to bedrock would be a continued source of CVOCs in groundwater for a significant period of time.

Long-Term Effectiveness and Permanence:

The groundwater extraction and ex-situ treatment system would be effective in the long term as long as the treatment system remains in operation. If the system ceases operation, this alternative would no longer be effective.

Short-Term Impact and Effectiveness:

In the short-term, the groundwater extraction and ex-situ treatment system would be effective in reducing contaminants as long as the treatment system remains in operation. If the system ceases operation, this alternative would no longer be effective.

Reduction of Toxicity, Mobility, or Volume with Treatment:

The groundwater extraction and ex-situ treatment system would reduce mobility of contaminants but would not significantly reduce toxicity or volume of contaminants. This alternative provides hydraulic control of the plume; but, does not treat source material.

Implementability:

The groundwater extraction and ex-situ treatment system would be relatively difficult to implement due to significant operation and maintenance requirements in the short term and long term. Utilities including electric and sewer would need to be brought on-Site as there are currently no utilities at the Site.

Cost:

The groundwater extraction and ex-situ treatment system alternative is relatively costly to implement. The estimated cost to implement this alternative is \$3.0 million with a 30 year operation and maintenance cost of \$1.5 million.

Land Use:

The groundwater extraction and ex-situ treatment system alternative would be consistent with land use which is industrial.

Green Remediation:

Groundwater extraction and ex-situ treatment system would not be green due to the continuous long term operation of the system including electricity usage.

11.4 In-Situ Source Treatment with PRB

Overall Protection of Public Health and the Environment:

In-situ source treatment with PRB would be protective to public health and the environment because there would be no exposure to contaminated soil/ fill or bedrock to the public. The PRB would prevent off-Site migration that may pose a threat to human health or the environment off-Site. There would be no increase in odors or dust to the surrounding public. There is some increased potential exposure to contaminated materials by on-Site workers during drilling and injection work.

Compliance with SCGs:

In-situ source treatment with PRB would not comply with SCGs in the source area as impacted soil/ fill above Industrial Use SCOs would not be removed or degraded to these levels. Groundwater downgradient of the PRB would be treated to meet SCGs; however, back diffusion of CVOCs sorbed to bedrock would be a continued source of CVOCs in groundwater for a significant period of time.

Long-Term Effectiveness and Permanence:

The in-situ source treatment would not be effective in the long term because back diffusion from bedrock would provide a continued source of CVOCs in groundwater. The PRB would be effective in the long term as long as the PRB is replenished once the treatment chemical loses effectiveness (assumed to be every 10 years).

Short-Term Impact and Effectiveness:

In the short-term, in-situ source treatment and the PRB would be effective in reducing contaminants. There would be little impact to the surrounding community due to implementation of this alternative; however, there would be some truck traffic for delivery of treatment chemicals, etc. If bedrock blasting were to be utilized to construct the PRB, vibration monitoring would be conducted in the surrounding area to monitor any effects on surrounding infrastructure. There is a possibility for utilities to be effected by the bedrock blasting; however, the pilot test work did not indicate this to be an issue. Previous soil vapor testing findings during the ISCR PRB pilot test caused no short term impacts to soil vapor.

Reduction of Toxicity, Mobility, or Volume with Treatment:

In-situ source treatment would reduce the volume of contaminants; however, back diffusion will provide a continued source of CVOCs to groundwater and thus contaminant concentrations would likely rebound and toxicity and volume would remain a concern. The PRB would reduce toxicity of contaminants on the downgradient side of the PRB including off-Site by reducing CVOCs into less harmful breakdown products; thus, treating the mobility concern and reducing the toxicity and volume of contaminants as they migrate. While the volume of the P-1 Plume is decreasing and will continue to decrease with this alternative, the volume of source material will not be significantly reduced. Both the in-situ source treatment and PRB may cause a temporary increase in mobility of contaminants as injection methods and/or bedrock blasting may mobilize contaminants in bedrock. Mobility of contaminants in the long term will be reduced.

Implementability:

In-situ source treatment with PRB would be relatively difficult to implement due to the significant amount of injection wells required in the source area (approximately 118 wells). In an effort to minimize mobilization of contaminants in the source area, bedrock blasting would not be

implemented in the source area. As such, the tighter spacing of approximately 118 injection wells would be required in the source area.

Cost:

The in-situ source treatment with PRB alternative is relatively costly to implement. The estimated cost to implement this alternative are \$4.9 million for the blasted bedrock trench and \$5.5 million for pneumatic, with a 30 year operation and maintenance cost of \$1.8 million for the blasted bedrock trench and \$3 million for pneumatic.

Land Use:

The in-situ source treatment with PRB alternative would be consistent with land use which is industrial.

Green Remediation:

In-situ source treatment with PRB would be green because contaminants are being treated in-situ and additional utilities are not required. There would be spoils associated with well installation, but this is minimal compared to the excavation approach.

11.5 PRB with MNA

Overall Protection of Public Health and the Environment:

PRB with MNA would be protective to public health and the environment because there would be no exposure to contaminated soil/ fill or bedrock to the public. The PRB would prevent off-Site migration that may pose a threat to human health or the environment off-Site. There would be no increase in odors or dust to the surrounding public. There is some increased potential exposure to contaminated materials by on-Site workers during drilling and PRB construction. Based on soil vapor screening conducted during the ISCR PRB pilot test, off-Site migration of soil vapor does not appear to be an issue.

Compliance with SCGs:

PRB with MNA would not comply with SCGs for the source area soil/ fill above Industrial Use SCOs. Groundwater downgradient of the PRB would be treated to meet SCGs; however, back diffusion of CVOCs sorbed to bedrock within the source area would be a continued source of CVOCs in groundwater for a significant period of time.

Long-Term Effectiveness and Permanence:

PRB with MNA would be effective in the long term as long as the PRB is replenished once the treatment chemical loses effectiveness (assumed to be every 10 years). It should be noted that reinjection into the PRB area may present some complications at that time and additional injection wells adjacent to the previously installed PRB may be necessary.

Short-Term Impact and Effectiveness:

In the short-term, PRB with MNA would be effective in reducing contaminants. There would be little impact to the surrounding community due to implementation of this alternative; however, there would be some truck traffic for delivery of treatment chemicals, etc. If bedrock blasting were to be utilized to construct the PRB, vibration monitoring would be conducted in the surrounding area to monitor any effects on surrounding infrastructure. There is a possibility for utilities to be effected by

the bedrock blasting; however, the pilot test work did not indicate this to be an issue. Previous soil vapor testing findings during the ISCR PRB pilot test caused no short term impacts to soil vapor.

Reduction of Toxicity, Mobility, or Volume with Treatment:

PRB with MNA would reduce toxicity of contaminants on the downgradient side of the PRB including off-Site because these technologies will both reduce CVOCs into less harmful breakdown products; thus, treating the mobility concern and reducing the toxicity and volume of migrating contaminants. While the volume of the P-1 Plume is decreasing and will continue to decrease with this alternative, the significant volume of source material will only be minimally reduced. The PRB may cause a temporary increase in mobility of contaminants as injection methods and/or bedrock blasting may mobilize contaminants in bedrock. Based on the ISCR PRB pilot test, mobility of contaminants in the long term will be reduced.

Implementability:

A pilot test was completed to evaluate this technology and proved that this technology was easy to implement.

Cost:

The PRB with MNA alternative is cost effective. The estimated cost to implement this alternative via blast-enhanced bedrock trench with hydraulic injections are \$1.6 million for the blasted bedrock trench and \$2.1 million for pneumatic, with a 30 year operation and maintenance cost of \$1.8 million for the blasted bedrock trench and \$3 million for pneumatic.

Land Use:

The PRB with MNA alternative would be consistent with land use which is industrial.

Green Remediation:

PRB with MNA would be green because contaminants are being treated in-situ and additional utilities are not required. There would be spoils associated with well installation, but this is minimal compared to the excavation approach.

11.6 MNA

Overall Protection of Public Health and the Environment:

MNA would be protective to public health and the environment because there would be no exposure to contaminated soil/ fill or bedrock to the public. There would be no increase in odors or dust to the surrounding public. Based on the MNA evaluation conducted during the RI, degradation is occurring; however, degradation at the property boundary is incomplete. Institutional controls will prevent off-Site exposure if implemented properly.

Compliance with SCGs:

MNA would not comply with SCGs as impacted soil/ fill above Industrial Use SCOs would not be removed. Back diffusion of CVOCs sorbed to bedrock within the source area would be a continued source of CVOCs in groundwater for a significant period of time. Biodegradation would continue to occur and the P-1 Plume would continue to decrease in size; however, it is assumed that the CVOCs within the source area would remain for a significant period of time.

Long-Term Effectiveness and Permanence:

MNA would be effective in the long term because the P-1 Plume would continue to decrease in size and biodegradation would continue to occur; however, source area impacts will remain for a significant period of time.

Short-Term Impact and Effectiveness:

Short-term effects of MNA would be negligible as this alternative requires long-term groundwater monitoring to measure effects. There would be little impact to the surrounding community due to implementation of this alternative.

Reduction of Toxicity, Mobility, or Volume with Treatment:

MNA would reduce toxicity of contaminants migrating downgradient and off-Site because biodegradation will continue to reduce CVOCs into less harmful breakdown products. Mobility of contaminants will also be reduced in the long term because the overall size of the P-1 Plume is decreasing. While the volume of the P-1 Plume is decreasing, volume of source material will only minimally decrease with MNA.

Implementability:

MNA would be easy to implement.

Cost:

The MNA alternative is cost effective. The estimated cost to implement this alternative is \$1.1 million with a 30 year operation and maintenance cost of \$463,000.

Land Use:

The MNA alternative would be consistent with land use which is industrial.

Green Remediation:

MNA would be green because contaminants are being treated in-situ and additional utilities are not required. There would be spoils associated with well installation but this is minimal compared to the excavation approach.

A table representing the evaluation of each alternative is provided on the following page.

Summary of Evaluation of Alternatives

Alternative	Protection of Human Health and the Environment	Compliance with SCGs	Long-Term Effectiveness	Short-Term Effectiveness	Reduction of Toxicity, Mobility or Volume	Ease of Implementation	Cost-Effective	Appropriate based on Future Anticipated Land Use	Green
A. Excavation		X	X	X	X			X	
B. Electrical Resistance Heating	X	X	X	X	X			X	X
C. Groundwater Extraction and Ex-Situ Treatment System	X	X*	X	X	X			X	
D. In-Situ Source Treatment with PRB	X	X*		X	X			X	X
E. Permeable Reactive Barrier with Monitored Natural Attenuation	X	X*	X	X	X	X	X	X	X
F. Monitored Natural Attenuation		X*	X			X	X	X	X

Shaded row indicates selected alternative.

* indicates alternative will comply with SCGs in the top 1-ft with ICs and ECs in place and SCGs may be achieved in the subsurface in the long term as CVOCs in groundwater degraded via natural attenuation. A cap/ cover will be applied for all alternatives to meet SCGs in the top 1-ft across the entire Site.

12. Recommended Alternative- PRB with MNA

The PRB with MNA alternative is protective to human health and the environment, will comply with SCGs in the top 1-ft in the short term and may meet SCGs in the subsurface overtime, is effective in the short-term and long-term for reducing contaminant migration off-Site, is relatively easy to implement, is cost-effective, is appropriate for land use (industrial) and is 'green'. This alternative meets each of the evaluation criteria and meets more evaluation criteria than any other alternative that was evaluated. Community acceptance will be evaluated during a public comment period; however, opposition from the community is not anticipated.

Based on the evaluations completed to date including the 2017 pilot test, a PRB with MNA is a viable remedy for the P-1 Plume and is recommended as the final remedy in conjunction with the ICs and ECs discussed in Section 13. Further details regarding the recommended remedy are provided in the following subsections.

12.1 PRB

A Pilot Test Work Plan dated October 2017 was completed which evaluated various treatment chemicals and injection methods for implementing ISCR via a PRB.

The following iron products were considered:

- a. Nano Scale ZVI
- b. Micro Scale ZVI
- c. Emulsified ZVI
- d. Colloidal ZVI and Carbon
- e. Micro Scale ZVI and Carbon

The following delivery methods were considered:

- a. Pneumatic injection
- b. Blast-enhanced bedrock trench hydraulic injection

The selected treatment chemical for the pilot test was micro scale ZVI. Both delivery methods were selected for pilot testing. The pilot test was implemented from October to November 2017 and groundwater monitoring was conducted at 2 months, 3.5 months, 7 months, and 15 months subsequent to the ISCR PRB pilot test. A PRB was constructed using each delivery method. A blast-enhanced bedrock trench PRB was constructed 50-ft in length, 5-ft in width, and 16-ft in depth (from 0-16-ft btr). Approximately 28,000 lbs of ZVI was injected via hydraulic methods into the blast-enhanced bedrock trench. A separate PRB 90-ft in length, 30-ft in width and 16-ft in depth (from 0-16-ft btr) was constructed via pneumatic injections. Refer to Figure 6 for the pilot test location. Approximately 28,000 lbs of ZVI was injected in the PRB constructed via pneumatic techniques. The results of the pilot test are further detailed in the *Pilot Test Monitoring Report* included as Appendix 1. A summary of the conclusions drawn from the pilot test is as follows:

General Conclusions/ Recommendations:

- ZVI appears to be effective in reducing CVOCs in groundwater associated with the P-1 Plume. ZVI can be injected at adequate volume and dosing within bedrock Zones A and B which contain a majority of the contaminant mass in both the bedrock matrix and the groundwater matrix.
- Initial increases in the concentration of contaminants were observed with both ZVI placement approaches. The increase in total CVOCs may be due to several factors:
 - Previous drilling work indicated a potential for contaminants to be displaced from bedding planes and fractures during drilling of the bedrock. Well installations, bedrock blasting, and/or ZVI injections may have moved groundwater around the bedrock zone being monitored. Sampling within a short duration after well installations, bedrock blasting, and/or ZVI injections may not have allowed the bedrock zone being monitored to equilibrate.
 - The RI data indicated that bedrock matrix samples from LAB-SBW-15 and LAB-SBW-16 contained CVOCs in the rock matrix. This contaminant mass in the bedrock within and downgradient of the PRB likely contributed to increased CVOCs initially since the PRB construction disturbed the equilibrium in the bedrock and may have lead to a release of some contaminants from the bedrock matrix (particularly with the enhanced bedrock trench due to the significant increase in surface area of the rock matrix due to the blasting).
- The location of any PRB in comparison to the source should consider impacts in the bedrock matrix. The pilot test PRBs considered this during the planning phase; however, based on lower groundwater concentrations and the ability to utilize existing well distribution, the pilot test PRBs were constructed north of LAB-SBW-15 and LAB-SBW-16. CVOCs in the rock matrix downgradient of the PRB will contribute to the downgradient groundwater concentrations due to back diffusion. Based on this, consideration should be given to moving the PRB south of the pilot test location.

The following method specific conclusions/recommendations were made during the pilot test:

Blast Enhanced Bedrock Trench

- PRB Area – The blasting work assumed a 2.5 ft. radius of influence (i.e., 5-ft. diameter). Measurements/observations of the area effectively blasted could not be obtained. As such, the assumed radius is utilized (note, based on extensive experience by the blasting company the blast area appears to be typical and there is little concern for any significant variation). The ZVI was observed in all locations within the trench with the exception of ML-7D. It should be noted that the shallow monitoring intervals of ML-6S and ML-7S contained significant ZVI (over 3 ft.); however, ML-8S did not have a measurable difference for the depth to bottom. Figure 6 illustrates the estimated area of the PRB. The material was easily placed within the trench via one injection point indicating an effective ‘radius’ of influence of at least 30-ft. (note, radius for the blast enhanced bedrock trench refers to the distance the material was observed to be placed laterally within the trench and is limited to the length and width of blasted bedrock trench itself). However, based on

the significant amount of ZVI observed in the shallow intervals on either side of the injection point (i.e., ML-6 and ML-7) and a lack of significant ZVI in ML-8, a more conservative radius of influence of 20 to 25 ft. would be recommended for this approach.

- PRB Thickness – The RI Report indicated a groundwater velocity of 2 to 3 ft/day. The blast enhanced bedrock trench pilot test utilized a single row of blast points with an estimated 5-ft. diameter. As such, the residence time of the water flowing through the PRB is approximately 1.7 to 2.5 days. Based on the available data, complete degradation appears to be occurring (as noted by increasing concentrations of ethane and ethene in LAB-SBW-15); however, some CVOCs were still present in LAB-SBW-15. This may be a function of inadequate residence time; however, it may also be due to contaminant mass in the bedrock matrix in the area of LAB-SBW-15. As noted above, a full-scale PRB is recommended to be completed further south of the pilot PRB. This should address the potential back diffusion issues in the area of the current PRB. In this event, LaBella would recommend that the blast enhanced bedrock trench PRB utilize the current thickness (with additional dosing noted below). Monitoring on the downgradient side would determine if any areas require re-assessment.
- Dosing Rate – This approach utilized a dosing rate of 6% (mass of ZVI amendment to mass of bedrock). There was no ‘day-lighting’ of material observed and excessive back pressure was not incurred during the injection intervals. Although ZVI was observed in all intervals, except MW-7D, additional ZVI could likely have been placed. A full scale injection via a blast enhanced bedrock trench could utilize a higher dosing rate. Although the actual amount that could be placed may vary, for planning purposes a dosing rate of 8% or 10% should be utilized.

Pneumatic Injection

- PRB Area – The pneumatic injection work assumed a 15-ft. radius of influence for each injection point. The injection work around IP-4 and IP-5 appeared to influence the multi-level wells nearest these locations (ML-1 and ML-2); however, IP-4 did not appear to influence locations to the west (IP-3 and ML-4) to the same degree as to the east. In addition, ZVI was not observed in the intermediate and deep intervals at ML-3 (i.e., ML-3I and ML-3D) which is only 8 ft. north of IP-3. Additionally, ZVI was not observed in ML-5 intermediate interval (i.e., ML-5I). This variable influence is expected in a fractured bedrock zone. Based on this, some overlapping of intervals would be recommended for a full-scale pneumatic injection. This could include a second row of injection points off-set from the initial row.
- PRB Thickness – The RI Report indicated a groundwater velocity of 2 to 3 ft/day. The pneumatic injection PRB pilot test utilized a single row of injection points with an estimated 30-ft. diameter. As such, the residence time of the water flowing through the PRB is approximately 10 to 15 days. Based on the available data, complete degradation appears to be occurring (as noted by increasing concentrations of

ethane and ethene in LAB-SBW-16); however, some CVOCs were still present in LAB-SBW-16. This may be a function of inadequate residence time; however, it may also be due to contaminant mass in the bedrock matrix in the area of LAB-SBW-16. As noted above, a full-scale PRB is recommended to be completed further south of the pilot PRB. This should address the potential back diffusion issues in the area of the current PRB. Also, as noted above, overlapping injection points are recommended to ensure a continuous PRB and if completed with an additional row, this would increase the PRB thickness. Monitoring on the downgradient side would determine if any areas require re-assessment.

- Dosing Rate – This approach utilized a dosing rate of 0.6% (mass of ZVI amendment to mass of bedrock). There was no ‘day-lighting’ of material observed and excessive back pressure was not incurred during the injection intervals. ZVI was not observed in all intervals as noted above and additional ZVI could likely have been placed. A full scale pneumatic injection could utilize a higher dosing rate. Although the actual amount that could be placed may vary, for planning purposes a dosing rate of 1% should be utilized.

Based on the pilot test results, ZVI would be successful in constructing a PRB to meet the remedial action objectives and both delivery methods would be successful in constructing a PRB to meet the remedial action objectives. The selected delivery method will be detailed in a Remedial Action Work Plan.

12.2 MNA

In accordance with EPA *Technical Protocol for Evaluating Natural Attenuation of Chlorinated Solvents in Ground Water* dated September 1998 (“EPA Technical Protocol”), a preliminary analysis was performed using the data collected during the RI (May 2017 low-flow sampling event) to determine if biodegradation is occurring. In accordance with the EPA Technical Protocol, the evaluation compared data from 1) the most contaminated portion of the aquifer (i.e., source area), 2) downgradient from the source area but still in the dissolved contaminant plume, 3) downgradient from the dissolved contaminant plume, and 4) upgradient and lateral locations not affected by the plume. The following classifications were used:

Source Area	LAB-SBW-04, LAB-SBW-05, LAB-SBW-09
Downgradient but within dissolved contaminant plume	LAB-SBW-15, LAB-SBW-16
Downgradient from dissolved plume	GMX-MW-3, GMX-MW-6S
Upgradient (background)	LAB-SBW-11

The following table includes the evaluation criteria on Table 2.3 of the EPA Technical Protocol that were met and the corresponding value applied for each criteria. Data was averaged for each classification of wells for this evaluation.

EPA Technical Protocol for Evaluating Natural Attenuation of Chlorinated Solvents in Groundwater- Preliminary Screening Evaluation

Analysis	Criteria to be met	Interpretation	Units	Source	Downgradient, within dissolved Plume	Downgradient from Plume	Upgradient (Background)	Value from EPA Technical Protocol
Oxygen	<0.5 mg/L in most contaminated zone	Tolerated, suppresses the reductive pathway at higher concentrations	mg/L	0.24	0.24	2.74	0.34	3
Methane	>0.5 mg/L in most contaminated zone	Ultimate reductive daughter product, VC accumulates	mg/L	0.57	0.38	0.74	1.2	3
ORP	<-100 mV in most contaminated zone	Reductive pathway likely	mV	-121.9	-109.3	-2.85	-156.8	2
pH	5<pH<9 in most contaminated zone	Optimal range for reductive pathway	--	7.0	6.9	7.0	6.7	0
TOC	>20 mg/L in most contaminated zone	Carbon and energy source; drives dechlorination; can be natural or anthropogenic	mg/L	23.10	28.35	16.95	30.80	2
Chloride	source is >2X background	Daughter product of organic chlorine	mg/L	644	689	212	225	2
BTEX	>0.1 mg/L in most contaminated zone	Carbon and energy source; drives dechlorination	mg/L	0.2	0.02	0.01	ND	2
DCE	Present as daughter product of DCE in most contaminated zone. If cis is > 80% of total DCE, it is likely a daughter product	Daughter product of TCE	% of total DCE	98%	100%	100%	ND	2
VC	Present as daughter product of DCE in most contaminated zone	Daughter product of DCE	ug/L	4,791	94.8	152.5	ND	2
Total								18

Parameters including oxygen, ORP, and pH were collected in the field, and the readings immediately prior to sample collection (i.e., when parameters were stabilized) from the May 2017 sampling were used in the evaluation. The average oxygen concentration in the source area was 0.24 mg/L, which met the criteria of less than 0.5 mg/L. The average methane concentration in the source area was 0.57 mg/L, which met the criteria of greater than 0.5 mg/L. The average ORP in the source area was -121.9 millivolts (mV) which met the criteria of less than -100 mV. The average total organic carbon (TOC) concentration in the source area was 23.10 mg/L, which met the criteria of >20 mg/L. The average chloride concentration in the source area was 644 mg/L, which is more than double the upgradient/ background concentration of 225 mg/L. BTEX is present in the source area at 0.2 mg/L, which met the criteria of greater than 0.1 mg/L. Cis-1,2-dichloroethene is present at greater than 80% of total DCE in the source area indicating it is a daughter compound of TCE as opposed to material released. Similarly, vinyl chloride was present at much higher concentrations in the source area than downgradient and concentrations have increased over time indicating vinyl chloride is present as a daughter product of DCE as opposed to material released.

In accordance with the EPA Technical Protocol Table 2.4, the total score is 18 which indicates there is “*Adequate Evidence for anaerobic biodegradation (reductive dechlorination) of chlorinated organics*”. Additionally, CSIA results indicate natural transformation of parent material (PCE and TCE) to daughter products is occurring.

In addition to this evaluation, pilot test data also indicates MNA is occurring downgradient of the PRBs installed based on complete degradation as indicated by increasing concentrations of ethane and ethene in wells downgradient of the PRBs (LBA-SBW-15 and LAB-SBW-16). In addition, parent compounds PCE and TCE have decreased to non-detect during the last round of pilot test monitoring with the exception of 14 ppb TCE in ML-7D in which ZVI was not observed (decreased from 100 ppb from baseline).

Based on the evaluations completed, MNA is occurring and is a viable remedial technology for implementation at the Site in conjunction with a PRB.

13. Institutional and Engineering Controls

In addition to the recommended PRB with MNA approach, ICs and ECs are required to comply with SCGs.

13.1 Institutional Controls

The following ICs are currently in place and will remain in place as part of the final remedy:

- Two (2) guidance documents have been developed for the FESL:
 - **Former Emerson Street Landfill Sub-Slab Ventilation Guidance Document Update 2013 by LaBella dated October 2013**- This document provides guidance on evaluating and mitigating SVI for buildings on the FESL. This document will be implemented for any buildings constructed at the Site in the future.
 - **Guidance for Waste-fill Management During Site Development on the Former**

- 36 -

Feasibility Study
NYSDEC Site #828023
Former Emerson Street Landfill- P-1 Plume
Rochester, New York
LaBella Project No. 210173

Emerson Street Landfill by LaBella dated October 2013- This document provides guidance on identifying, handling, managing and disposing of fill material associated with the FESL. This document will be implemented during any subsurface work at the Site.

- All properties on the FESL are flagged in the City's permit system which prevents permit issuance without consideration for FESL-related concerns including fill material and the potential for SVI. City Division of Environmental Quality staff review permit requests for properties on the FESL to ensure the appropriate ICs/ ECs are implemented.
- The use of groundwater in the City is prohibited by City code.

13.2 Engineering Controls

The recommended remedial alternative, PRB with MNA will not meet SCGs; as such, a cover system will be constructed across the entire 1700 Emerson Street parcel to prevent exposure to contaminated subsurface material. The cover system will consist of a minimum of 1-ft of imported soil and/ or crushed stone that meets NYSDEC Industrial Use SCOs. In 1971 the landfill was officially closed and a contract for the closure of the eastern half of the landfill specified 2 feet of cover material (preferred to be a sandy loam) to be placed and compacted to 30% in 1 foot lifts. The cover system across the 1700 Emerson Street parcel varies in thickness; as such, a cover system will be reconstructed across the 1700 Emerson Street parcel.

The berm near the center of the Site will be regraded to level out the Site. Subsequently, the existing approximate 20,000 CY of staged material in the southeastern portion of the Site that meets SCGs, and an additional 10,000 CY or more, of material that meets SCGs will be brought onto the Site and placed across the Site as the final cover. A total of 30,000 CY will provide approximately 1.5-ft of cover across the entire Site. Proper stormwater drainage will be installed and maintained as part of the cover system design. In addition, stickup well casings will be modified (raised/ lowered based on final grades) to be accessible following regrading/ cover. Lastly, additional fencing will be added to the western property boundary so the entire Site is secured with fencing.

- 4) Contours represent total chlorinated volatile organic compounds (CVOCs) in groundwater. The overall plume represents an interpretation of contaminants based on cumulative testing completed from 2014-2017 and does not represent one single sampling event. The A Zone is sealed out in bedrock monitoring wells. Data collected from the A Zone during well installation is considered screening level data and is not included in this model.
- 5) Concentrations in micrograms per liter (ug/L) or parts per billion (ppb).
- 6) Testing locations were located using a GPS.
- 7) Treatment area includes 118 injection wells across 26,000 square foot area.
- 8) PRB is 375 ft in length perpendicular to groundwater flow with 8 injection wells and 75 blast points.

			<i>Annual Cost Years 6-30</i>	\$ 7,950	\$ 3,797
30 Year O&M Cost					\$ 173,322
Contingency (20%)					\$ 34,664
Present Value O&M (30 Years)					\$ 207,987
Estimated Remedial Cost 30 Years:				\$ 24,690,879	

Includes excavation and disposal of 100,000 square foot area to 30 ft bgs (~180,000 tons)

Top 15 feet of soil/ fill can be reused in backfill

Assumes 2 ft above top of rock and 3 feet of bedrock are hazardous. Remaining is non-hazardous.

Assumes up to 8 months of excavations

Assumes confirmatory sampling in accordance with NYSDEC DER-10. Metals, pesticides, and PCBs to be sampled at a reduced frequency

Dewatering will include temporary storage in frac tanks and carbon treatment prior to discharge to the sanitary sewer

Excavation to extend up to 5 feet into bedrock

Post-remedial monitoring to include groundwater monitoring quarterly for 2 years, semi-annually for 3 years, and annually for 25 years

Post-remedial monitoring to include sampling up to 12 wells for TCL VOCs via passive diffusion bags

Present value assumes 3% annual discount rate

Cover system assumes regrading Site, and covering with 20,000 CY existing stockpiled material plus transporting 10,000 CY additional from City facility on Colfax Street. Costs include trucking 10,000 CY to the Site from Colfax Street.

Existing monitoring well casings will be altered to be raised/ lowered as needed to accommodate final grade.

Notes:

- Source area treatment assumes 26,000 square feet area. Injections from 5-ft above top of rock to 5-ft below top of rock.
- Source treatment wells spaced 15-ft apart. Depths will vary based on location to treat up to the Upper B Zone.
- Blast points to be spaced 5-ft apart. PRB injection points to be spaced 50 feet apart within blasted bedrock trench.
- PRB assumes barrier 375-ft in length installed from 0-16-ft btr following bedrock blasting.
- Assumes ZVI dosing is 10% bedrock mass.
- Every 10 years the PRB will be replenished with ZVI via hydraulic injections. This will include injecting up to 350,000 lbs via existing injection wells.
- Post-remedial monitoring to include groundwater monitoring quarterly for 2 years, semi-annually for 3 years, and annually for 25 years
- Post-remedial monitoring to include sampling up to 12 wells for TCL VOCs and MNA parameters
- Present value assumes 3% annual discount rate
- Cover system assumes regrading Site, and covering with 20,000 CY existing stockpiled material plus transporting 10,000 CY additional from City facility on Colfax Street. Costs include trucking 10,000 CY to the Site from Colfax Street.
- Existing monitoring well casings will be altered to be raised/ lowered as needed to accommodate final grade.

				<i>Groundwater Monitoring Annual Cost Years 11-30</i>	\$11,825
					\$6,547
30 Year O&M Cost					\$385,198
Contingency (20%)					\$77,040
Present Value O&M (30 Years)					\$462,238
				Estimated Remedial Cost 30 Years:	\$1,501,636

Notes:

Post-remedial monitoring to include groundwater monitoring quarterly for 2 years, semi-annually for 3 years, and annually for 25 years

Post-remedial monitoring to include sampling up to 12 wells for TCL VOCs and MNA parameters

Present value assumes 3% annual discount rate

Cover system assumes regrading Site, and covering with 20,000 CY existing stockpiled material plus transporting 10,000 CY additional from City facility on Colfax Street. Costs include trucking 10,000 CY to the Site from Colfax Street.

Existing monitoring well casings will be altered to be raised/ lowered as needed to accommodate final grade.

1.0 Introduction

This report summarizes results of a pilot test that was conducted to evaluate a potential remedial technology to be implemented for remediation of a chlorinated volatile organic compound (CVOC) groundwater plume (the P-1 Plume) at the Former Emerson Street Landfill (FESL) located at 1700 Emerson Street (formerly 1655 Lexington Avenue), Rochester, New York (the Site). The FESL project location is shown on Figure 1.

Environmental investigations have been completed at the Site since the 1980s, including most recently a Remedial Investigation (RI) for the P-1 Plume conducted in accordance with the *Remedial Investigation Work Plan: P-1 Plume Area* dated November 2012 and five (5) subsequent addenda completed by LaBella. The purpose of the RI was to define the nature and extent (areal and vertical extent) of VOCs, specifically CVOCs in soil, fill, groundwater and the bedrock matrix associated with the P-1 Plume. Previous investigations have identified CVOCs including trichloroethene (TCE), tetrachloroethylene (PCE) and breakdown compounds in groundwater at concentrations up to 69 parts per million (ppm) total CVOCs. The RI has defined the extent of the P-1 Plume as shown on Figure 3.

The RI was completed in 2017 and a Pilot Test Work Plan dated August 2017 was developed which evaluated various potential remedial technologies to remediate CVOCs associated with the P-1 Plume. The Pilot Test Work Plan identified in-situ chemical reduction (ISCR) with monitored natural attenuation (MNA) as a potential viable remedial technology for the P-1 Plume. The Pilot Test Work Plan proposed injection of zero valent iron (ZVI) via two (2) delivery methods; 1) pneumatic injections, and 2) blast-enhanced bedrock trench hydraulic injections to form a permeable reactive barrier (PRB) on the downgradient edge of the P-1 Plume.

The Pilot Test Work Plan was conditionally approved by the NYSDEC in a letter dated September 28, 2017. The Pilot Test commenced in October 2017 and the injection work was completed in November 2017. This report summarizes the pilot test procedures and results of the post-pilot test groundwater monitoring.

2.0 Site Background

2.1 Geology and Hydrogeology

The overburden in the P-1 area consists of waste/fill generally placed directly on top of bedrock during landfill operation. A thin, discontinuous layer of native sand/silt which is typically overlain by a layer of peat is present in some locations on top of bedrock and ranges from a few inches to a maximum observed thickness of 4.3-ft. A cover of approximately 2-ft of loam is present across the P-1 area.

The waste mass is generally unsaturated; however, a few thin perched zones of saturated conditions are documented and the lowermost 1-2-ft of overburden may seasonally exhibit groundwater.

Depth to bedrock ranges between approximately 23 and 27-ft below ground surface (bgs) at elevations ranging between approximately 519-522 feet above mean sea level (fmsl). Zones have been defined for bedrock and bedrock groundwater as follows:

A-Zone (>518 fmsl)- The A-Zone is comprised of the upper 3-ft of highly fractured and weathered top of bedrock and includes the lowermost portion of saturated overburden, where present.

Upper B-Zone (~512-518 fmsl)- The Upper B Zone spans the bedrock thickness between the A-Zone and B-Zone (3-8-ft btr) and does not exhibit laterally extensive fracturing, however fracture frequency from bedrock core (RQD) and televiewer information suggest a higher frequency of fracturing compared to deeper portions of the bedrock (C and D-Zones).

B-Zone (~508-512 fmsl)- The B-Zone is present from an elevation of approximately 508 to 512 feet above mean sea level (fmsl) (8-16-ft btr) and is characterized by the first laterally extensive high transmissivity fracture zone identified in bedrock core, downhole televiewer observations, and direct evidence of hydraulic communication between wells observed during bedrock coring using air rotary methods.

C-Zone (~494-508 fmsl)- The C-Zone is characterized by the second laterally-extensive fracture system identified through bedrock core, televiewer and hydraulic communication data and is present from approximately 494 to 508 fmsl (16-25-ft btr). The C Zone also exhibits more continuous sections of competent rock.

D-Zone (<494 fmsl)- The D-Zone flow system is characterized by significantly less fractures (RQDs greater than 80) and is present within the Rochester Shale at depths deeper than approximately 494 fmsl (25-ft btr) and below.

The uppermost bedrock at the Site is the Penfield Member of the Lockport Formation. Rochester Shale has been observed in two (2) locations where deep wells were installed (greater than 53-ft bgs) at elevations ranging between approximately 452-467 fmsl.

Groundwater seepage velocity for the shallow bedrock zone was determined to be approximately 3.2 ft/day with a flow gradient of 0.008 from north to south. Based on the invert elevations of the storm sewer in McCrackenville Street east of the P-1 Plume ranging between approximately 517.78-517.08 fmsl, groundwater seasonally discharges to the backfill creating a localized groundwater low parallel with McCrackenville and Emerson Streets and thus may result in slight changes in groundwater flow direction towards the sewer in McCrackenville Street seasonally.

2.2 Nature and Extent

The P-1 Plume impacts various media including groundwater, soil vapor, soil/ fill, and bedrock.

Groundwater: The source area of CVOCs in groundwater (encompassed by 2013-SB-01, LAB-OBW-01, 2016-SB-19, 2016-SB-20, LAB-DBW-01, LAB-SBW-02, LAB-SBW-09 and LAB-SBW-10) is approximately 16,000 sq. ft. Based on the reduction of CVOCs from 2000 to 2017 including an 84% decrease in total CVOCs in the P-1 well from 54.4 ppm to 8.9 ppm, and a

77% decrease in total CVOCs in GMX-MW-3 (downgradient) from 5.3 ppm to 1.2 ppm, natural attenuation of the plume is occurring.

A Zone (>518 fmsl): The greatest concentrations of CVOCs in groundwater to date have been detected in the A Zone. Specifically, monitoring wells LAB-DBW-02, LAB-SBW-05, LAB-SBW-09, and P-1 all contained greater than 15 ppm total CVOCs in at least one sampling event. The greatest concentration of total CVOCs in groundwater in the A Zone was 68.8 ppm in LAB-DBW-02. Approximately 38% of the CVOC mass in groundwater is in the A Zone.

Upper B Zone (~512-518 fmsl): The greatest concentration of CVOCs in groundwater in the Upper B Zone was 14.0 ppm in LAB-SBW-09. Approximately 23% of the CVOC mass in groundwater is in the Upper B Zone.

B Zone (~508-512 fmsl): The greatest concentration of CVOCs in groundwater in the B Zone was 21.0 ppm in P-1. Approximately 31% of the CVOC mass in groundwater is in the B Zone.

C Zone (~494-508 fmsl): The greatest concentration of CVOCs in groundwater in the C Zone was 5.2 ppm in LAB-SBW-05. Approximately 8% of the CVOC mass in groundwater is in the C Zone.

D Zone (<494 fmsl): The greatest concentration of CVOCs in groundwater in the D Zone was 0.08 ppm in LAB-DBW-02. There are three (3) wells in the D Zone at the Site; the other two (2) wells were non-detect (LAB-DBW-01 and GMX-MW-6D). There is a negligible amount of CVOC mass in the D Zone.

Soil Vapor: A FESL-wide SVI assessment was conducted from 2009-2017 documented in the 2011 SVI Assessment Report dated June 2011 and Draft SVI Investigation Report dated March 2018 and identified only one (1) building with impacted soil vapor from a FESL-related source. The south adjacent building to the Site (1740 Emerson Street) has been mitigated to prevent SVI related to the FESL. Institutional controls also prevent newly constructed buildings designed for regular occupancy to be occupied without being assessed or mitigated for SVI.

Soil/ Fill: Unincinerated fill material is generally present in the source area at depths ranging from 2-8-ft bgs, with ash present at greater depths. Total CVOCs have been detected in soil/fill at concentrations up to 766 ppm in LAB-OBW-01 at 23-24-ft bgs and total BTEX has been detected in soil/ fill at concentrations up to 3,040 ppm in 2016-SB-20 at 18-19-ft bgs. The greatest concentrations of CVOCs in soil/ fill are present directly above bedrock, generally at depths greater than 20-ft bgs in an approximate 8,000 sq. ft. area (approximately 1,800 cubic yards).

Bedrock: The uppermost 3-ft of bedrock contains the highest concentrations of CVOCs in the rock matrix in the source area. Concentrations of CVOCs generally decrease with depth in the source area. Concentrations of CVOCs in bedrock in wells downgradient of the source area (i.e., LAB-SBW-15 and LAB-SBW-16) were non-detect in the A Zones but were detected in the Upper B/ B Zones. The concentrations of CVOCs in the A Zone bedrock matrix are suggestive

of a DNAPL source in LAB-SBW-02, LAB-SBW-09, LAB-SBW-10, and LAB-DBW-01. The source area impacts in bedrock are approximately 60,000 sq. ft. and vary in elevations across that area from the A Zone to the B Zone. An estimated 18,000 cubic yards of bedrock impacts are present in the source area.

A Zone: The greatest concentration of total CVOCs in bedrock in the A Zone at the Site was 135.3 ppm in LAB-SBW-09. Approximately 75% of the CVOC mass in bedrock is in the A Zone (as shown below this is also approximately 63% of the total CVOC mass in the P-1 Plume source area). Concentrations of CVOCs in LAB-SBW-02 (TCE), LAB-SBW-09 (TCE), LAB-SBW-10 (PCE) and LAB-DBW-01 (PCE) in this zone are suggestive of a DNAPL source.

B Zone: The greatest concentration of CVOCs in bedrock in the B Zone at the Site was 60 ppm in LAB-SBW-05. Approximately 28% of the CVOC mass in bedrock is in the B Zone (as shown below this is also approximately 25% of the CVOC mass in the P-1 Plume area). Concentrations of CVOCs in LAB-SBW-05 (PCE) in this zone are suggestive of a DNAPL source; however, the sample from the A Zone at this location was significantly lower (approximately 126 times lower) which suggest the DNAPL migrated to this location from the source area.

C Zone: The greatest concentration of CVOCs in bedrock in the C Zone at the Site was 0.466 ppm in LAB-SBW-16. There is a negligible amount of CVOC mass in C Zone bedrock.

D Zone: The greatest concentration of CVOCs in bedrock in the D Zone at the Site was 0.016 ppm in LAB-DBW-01. There is a negligible amount of CVOC mass in D Zone bedrock.

A summary of the estimated distribution of contaminant mass is included in the following table.

Distribution of Contaminant Mass in P-1 Plume Study Area

Zone	Soil		Bedrock		Groundwater		Total Mass by Zone	
	Mass (lbs)	% of total Mass	Mass (lbs)	% of total Mass	Mass (lbs)	% of total Mass	Mass (lbs)	% of total Mass
Overburden/ Fill	232	11.78%	--	--	--	--	232	11.78%
Bedrock A Zone	--	--	1,233	62.62%	5	0.25%	1,238	62.87%
Bedrock B1 Zone	--	--	491	24.94%	3	0.15%	498	25.29%
Bedrock B Zone	--	--			4	0.20%		
Bedrock C Zone	--	--	0.10	--	1	0.05%	1	0.05%
Bedrock D Zone	--	--	<0.01	--	<0.01	--	<0.01	0.01
Total Mass (lbs)	232	11.78%	1,724	87.56%	13	<1%	1,969	100%

Notes:

Mass calculations estimated based on concentration contours developed using modeling software.

Assumptions:

Mass of bedrock = 165 lb/ ft³

Mass of soil = 100 lb/ ft³

Porosity of bedrock 10%

The estimated total mass of CVOCs in soil/ fill is 232 lbs (or 11.78% of total mass), groundwater is 13 lbs (or less than 1% of total mass), and bedrock is 1,724 lbs (or 87.56% of total mass). A majority of contaminant mass is in bedrock as opposed to the overburden native soil/ fill material. Calculated porewater concentrations exceed the solubility limits for parent compounds PCE and TCE in bedrock in several locations, which indicates DNAPL source material is suspected, even in the absence of visual confirmation. The significance of these findings relates to contaminant diffusion into the bedrock matrix and the likely presence of DNAPL in tight, closed-ended fractures. Under these situations, back diffusion from the bedrock matrix to groundwater will pose a long-term source of groundwater contamination.

2.3 Conceptual Site Model

During the last years of filling at the FESL, it appears some non-municipal waste was placed in the landfill in the vicinity of P-1 and more specifically in the area encompassed by 2013-SB-01, LAB-OBW-01, 2016-SB-19, 2016-SB-20, LAB-DBW-01, LAB-SBW-02, LAB-SBW-09 and LAB-SBW-10. This is supported by a review of aerial photographs, test pits, high concentrations of impacts in the overburden/ fill on top of bedrock, the presence of the greatest concentrations of CVOCs in A Zone groundwater, and bedrock matrix samples.

NAPL and/or high concentrations of VOC impacted groundwater appear to have migrated laterally and vertically from this source area. Based on rock matrix analysis, impacts migrated to the southeast to LAB-SBW-05 in the A Zone and Upper B Zone. Impacts (not NAPL) further migrated laterally to the west and southwest (LAB-SBW-13 and LAB-SBW-14) and to the south (LAB-SBW-15 and LAB-SBW-16) into the B Zone. This is evidenced by greater concentrations of CVOCs in the B Zone than in the A Zone in these locations. Impacts have not migrated at significant concentrations laterally to the southeast or vertically to the C or D Zones.

As the impacts have migrated downward vertically and laterally, natural degradation has been occurring. This is evidenced by greater concentrations of daughter compounds than parent compounds in bedrock groundwater. In addition, the source edge bedrock samples have a higher proportion of daughter compounds than the samples in the source area. Furthermore, the overall P-1 Plume area has decreased since 2000 and concentrations of total CVOCs have declined. Refer to Figure 3 for a representation of the P-1 Plume.

In accordance with the EPA Technical Protocol Table 2.4 evaluation performed, there is “*Adequate Evidence for anaerobic biodegradation (reductive dechlorination) of chlorinated organics*”. Additionally, compound-specific isotope analysis (CSIA) results indicate natural transformation of parent material (PCE and TCE) to daughter products is occurring. The mechanism for transformation was evaluated using Bio-Trap samplers. Analytical results indicate the presence of DHC (Dehalococcoides) and DHBt (Dehalobacter) in population ranges capable of natural biodegradation of CVOCs in the P-1 study area; however, biodegradation appears to be incomplete prior to regulated contaminants leaving the property boundary. This is supported by the fact that chloroethane, cis-1,2-dichloroethene, and vinyl chloride are detected in the downgradient wells. Specifically, chloroethane (145 ppb), cis-1,2-dichloroethene (751 ppb), and vinyl chloride (305 ppb) were detected in GMX-MW-3 downgradient of the source area proximate to the eastern property boundary in May 2017, and parent compounds were not detected.

3.0 Remedial Action Objectives

The primary Remedial Action Objectives (RAOs) are as follows:

Groundwater RAOs:

- a. Prevent ingestion of groundwater with contaminant levels exceeding drinking water standards;
- b. Prevent contact with, or inhalation of volatiles, from contaminated groundwater; and
- c. Prevent off-Site migration of contaminants in groundwater.

Soil RAOs:

- a. Prevent ingestion/ direct contact with contaminated soil;
- b. Prevent inhalation of or exposure from contaminants volatilizing from contaminants in soil; and
- c. Prevent migration of contaminants that would result in groundwater or surface water contamination.

Soil Vapor RAOs

- a. Mitigate impacts to public health resulting from existing, or the potential for, soil vapor intrusion into buildings at a site.

4.0 Pilot Test Objectives

Various remedial technologies were evaluated in the Pilot Test Work Plan including ISCR, electrical resistance heating (ERH), MNA, pump and treat, etc. The selected technology was ISCR with MNA. Various treatment chemicals and delivery methods were evaluated for the ISCR approach. The selected methodology to be implemented was a PRB using micro-scale ZVI (1-100 micron) injected via two (2) different delivery methods; 1) pneumatic injection and 2) hydraulic injections in a blast-enhanced bedrock trench. The primary objective of the pilot test was to:

- Assess the distribution of treatment chemical (i.e., radius of influence and uniformity of distribution) for two delivery method options.

A secondary objective was to:

- Monitor the ability to reduce CVOCs and completely degrade CVOCs in the PRB area in order to assess the required lateral width of the PRB.

5.0 Methodologies

Micro-scale ZVI was the selected treatment chemical. The ZVI was supplied by Hepure. A summary of the drilling and injection procedures for each delivery method are included in the following subsections. The work was completed in accordance with the Pilot Test Work Plan with the exception of deviations listed in Section 6.4. Refer to Figure 4 for location of the pilot test.

5.1 Blast-Enhanced Bedrock Trench

Shot holes were drilled by Nothnagle Drilling using a track mounted HCR 900 Rock Drill on October 2 and 3, 2017. Shot holes were drilled approximately 5-feet apart to create a 50-ft long trench 15-ft below the top of bedrock. Rock cores were not retrieved. Shot holes were drilled to approximately 15-ft btr (total depths ranging from approximately 38-38.5-ft bgs or 509.8-510.3 fmsl). A temporary 3-inch steel casing was installed in each shot hole. Five (5) shot holes were drilled on October 2, 2017 designated BH-1 through BH-5. Subsequently, Maine Drilling and Blasting loaded six (6) sticks of dynamite, each one 16-inches in length and 4.1 lbs, to each shot hole. The holes were filled with pea stone and temporary casings were removed. Blast mats were placed over the shot holes and dynamite wiring was interconnected above grade. The dynamite was detonated by Main Drilling and Blasting.

The last five (5) shot holes designated BH-6 through BH-10 were completed on October 3, 2017 in the same manner as the first five (5) with one exception. When BH-6 through BH-10 were drilled, the top of rock was not as fractured as anticipated; as such, seven (7) sticks of dynamite were utilized in BH-6 through BH-10 rather than six (6) sticks as utilized in BH-1 through BH-5. During blasting of BH-6 through BH-10, spouting was observed in LAB-SBW-15 approximately 15-ft south of the shot holes. Influence was not visually observed at the time of blasting at other monitoring wells. Packers were not placed in wells during the bedrock blasting.

Maine Drilling and Blasting placed seismographs on both buildings at 500 Lee Road to the west of the blast and at the southern end of the solar panel array at 1655 Lexington Avenue to the north of the blast. Seismograph readings were well below the action level of 2 peak particle velocity (ppv). Maine Drilling and Blasting's daily reports are included in Appendix 5.

5.2 Multi-Level Well Installation

Multi-level wells were designed to allow for visual evaluation of the distribution of ZVI at various discrete depth intervals. Eight (8) sets of multi-level wells designated ML-1 through ML-8 were installed by Nothnagle Drilling from October 2 to October 12, 2017 using a CME85 truck mounted drill rig. ML-6, ML-7 and ML-8 installed in the blast-enhanced bedrock trench were installed after the blasting from October 9 through October 11. Three (3) multi-level wells were installed within the blast-enhanced bedrock trench (ML-6, ML-7 and ML-8). The remaining five (5) multi-level wells were installed proximate the proposed pneumatic injection points at varying distances from proposed injection points. Rock was drilled with a 5 7/8 inch (inside diameter) roller bit to approximately 17-ft btr (elevations ranging from approximately 502.4-505.0 fmsl). Rock cores were not retrieved. Subsequently, three (3) 1-inch diameter PVC wells were installed at varying depth intervals. Well screens consisting of 0.020-slot PVC were installed at depths of approximately 0-3-ft btr (A Zone, >518 fmsl), 5-10-ft btr (Upper B Zone, 512-518 fmsl), and 12-17-ft btr (B Zone, 508-512 fmsl). The annulus of the screened sections was filled with pea stone to allow for ZVI to infiltrate the wells. The sections between the screens were sealed with bentonite to seal out the other monitoring zones. Refer to Appendix 1 for well construction logs. Well construction information is also included on Table 4.

5.3 Injection Point Installation

Five (5) injection points, designated IP-1 through IP-5, were installed by Cascade using a sonic drill rig from October 23-27, 2017. Two (2) of the injection points were installed in the blasted bedrock trench (IP-1 and IP-2). The remaining three (3) were installed farther east for pneumatic injections at approximate 30-ft spacing. Injection points were installed by drilling with a 7-inch diameter core barrel through the overburden and 1 to 2-ft btr to set a 5-inch steel casing. Subsequently, a 4.75-inch diameter core hole was drilled to depths of approximately 15-feet btr (terminal elevations ranging from 505.1 to 508.1 fmsl). The injection points were completed as open rock wells (i.e., no screen or sand pack installed). Rock cores were retrieved and photographs of the cores are included in Appendix 2. Refer to Appendix 1 for well construction logs.

Following installation of the injection points, each one was scoped with a Well-Vu camera to observe fractures. IP-1 installed within the blast-enhanced bedrock trench was blocked at approximately 30-ft bgs due to cave in. 4-inch PVC casing was placed in IP-1 and IP-2 temporarily to prevent further cave in prior to the injection work. Table 4 includes well information including screening intervals, and depths of fractures observed with the televiewer.

5.4 ZVI Injections

Blasted Bedrock Trench:

ZVI was injected at an approximate 6% dosing of the bedrock mass (i.e., mass of bedrock within the treatment zone) on November 7 and November 8, 2017. The slurry was mixed and injected by Cascade using an injection module which controls pressure and flow rate (refer to Appendix 4 for Cascade's Report which includes details regarding the injection equipment). Approximately 28,000 lbs of ZVI was injected into the blast-enhanced bedrock trench. All 28,000 lbs of material was injected into IP-2 near the center of the blast-enhanced trench (i.e., approximately 20 feet from the east end of the trench and 30 feet from the west end of the trench). IP-1 was to be utilized if distribution of ZVI was not observed in all multi-level wells within the trench (ML-6, ML-7 and ML-8). ZVI was observed in each of the multi-level wells in the trench; as such, IP-1 was not utilized. Additional details on the injections are included in Section 6.0. The following table summarizes injection intervals, quantities, flow rates and pressures for the blast-enhanced bedrock trench.

Blast-Enhanced Bedrock Trench Injection Summary

Injection Point ID	Date of Injection	Depth of Steel Casing (ft. bgs/ fmsl)	Depth of Well (ft bgs)	Injection Interval #	Injection Interval (ft bgs / fmsl)	Qty Water (gallons)	Qty ZVI (lbs)	Percent Slurry	Flow Rate (GPM)	Injection Pressures
IP-2	11/7-11/8	23 / 521.3	38 / 506.3	1	*24-38 / 506.3-520.3	1,223	5,529	35.15%	40-60	15-60
				2	*31-34 / 510.3-513.3	1,223	5,598	35.43%	40-45	40-60
				3	*27-31 / 513.3-517.3	1,223	5,598	35.43%	30-45	30-60
				4	*25-27 / 517.3-519.3	1,223	5,598	35.43%	30-45	35-50
				5	23-25 / 519.3-521.3	1,223	5,598	35.43%	30-45	30-60

Notes:

* indicates fracture observed with camera

Intervals are listed in order of injection

Top packer was mistakenly not inflated during interval #1; as such, the entire open rock interval represents the injection interval

Pneumatic Enhancement:

Pneumatic enhancement is a method of high pressure injection that is utilized to expand existing fractures for improved chemical delivery. Fractures were enhanced using nitrogen gas injected at pressures up to approximately 325 psi. Packer assemblies were utilized to target intervals of approximately 3-feet for ZVI delivery. During injection of the interval at the bottom of the injection point (i.e., approximately 12-15-ft btr) the bottom packer was left off the assembly and the top packer was inflated. During subsequent intervals, a bottom packer was added and inflated to target an approximate 3-ft interval.

A dosing of 0.6% of the “soil” mass (i.e., mass of bedrock within the treatment zone) was utilized. Pneumatic injections were completed from November 8-10, 2017. 9,250 lbs of ZVI was injected in each IP-4 and IP-5. 9,035 lbs of ZVI was injected in IP-3. Each interval received approximately 1,850 lbs ZVI per injection point with the exception of IP-3 in which 3,485 lbs (double the amount) was applied to the uppermost interval. The slurry ranged from approximately 35.24% to 41.57% iron. The following table summarizes injection intervals, quantities, flow rates and pressures for the pneumatic injections.

Pneumatic Injection Summary

Injection Point ID	Date of Injection	Depth of Steel Casing (ft bgs / fmsl)	Depth of Well (ft bgs / fmsl)	Injection Interval #	Injection Interval (ft bgs / fmsl)	Qty Water (gallons)	Qty ZVI (lbs)	Percent Slurry	Flow Rate (GPM)	Injection Pressures	Max Pressure During Pneumatic Enhancement	Maintenance Pressure (pneumatic only)

Notes:

* indicates depth with fracture observed with camera
Intervals are listed in order of time of injection

5.5 Soil Gas Screening

Per the NYSDEC conditional approval of the Pilot Test Work Plan, soil gas screening was conducted throughout the pilot test program on a regular basis to document the effects, if any, of the pilot test on soil vapor at the Site. Eight (8) soil gas points were installed across the Site to approximately 5-ft bgs. Soil gas points consisted of PVC screen backfilled with quartz sand. Soil gas points were installed at distances ranging from approximately 170 feet and 350 feet from the pilot test area in the direction of groundwater flow and between the P-1 Plume and locations of off-Site buildings (refer to Figure 5).

A set of baseline data was collected prior to any blasting or injections, on October 2, 2017. During pilot test work (drilling, blasting and injections), soil gas points were screened a minimum of once per day with a methane meter and PID. Soil gas points were also screened several days after the work concluded and again in June 2018 during the 3rd post-injection sampling event (approximately 6 months after injections). Methane and PID readings were recorded and are included on Table 3. Graphs representing methane readings and PID readings over the course of the work are attached.

The data did not present any definitive trends that could be attributed to pilot test work. The blasting and pneumatic injections did not appear to cause an increase in methane or VOCs in soil vapor at the Site. There is no correlation between pilot test activities and methane or VOCs in soil vapor.

6.0 Results

6.1 Performance Monitoring

Analytical testing was utilized to evaluate qualitative changes in concentrations of VOCs and other water quality parameters in groundwater. Two (2) other methods were utilized to assess distribution of ZVI; 1) pressure monitoring of surrounding wells during injections; and 2) visual observation of ZVI in surrounding monitoring wells.

Pressure Monitoring:

During pneumatic injections, packers were placed in surrounding wells. Pressure gauges were placed on select wells in the closest proximity to the injection location and at depths similar to injection depths. Pressures observed at surrounding wells are included on Table 5. It should also be noted that during injections in IP-3, spouting was observed at ML-7S in the blast-enhanced bedrock trench; however, a gauge was not installed.

During bedrock trench injections, pressure gauges were placed on wells within the bedrock trench (ML-6, ML-7 and ML-8) as well as LAB-SBW-09 and LAB-SBW-15. Wells within the bedrock trench were pressurized during injections. In general, wells within closest proximity (within 15-feet) to the pneumatic injection points that were screened at similar intervals to the injection interval became pressurized. Monitoring wells became pressurized up to 35-feet from pneumatic injections (pressure in LAB-SBW-16 during IP-5 injection 35-feet away, pressure in ML-1D during IP-4 injection 34-feet away, and pressure in LAB-SBW-16 during IP-3 injection 35-feet away). Intermediate intervals ML-1I and ML-2I were pressurized greater than 15 psi during IP-4 and IP-5 injections. In addition, ML-2S during injection of IP-4 and ML-4D during injection of IP-3 were pressurized greater than 15 psi. Refer to Table 5 for additional details.

Visual Observations:

Following injection of ZVI in each point, surrounding wells were visually evaluated for ZVI using bailers. A photograph log included as Appendix 2 contains photographs of a sample collected from each well post-injections. The following wells were gauged for ZVI during and after injections:

Visual Observation of Iron in Monitoring Wells

Well ID	ZVI Observed	Nearest Injection Point/ Distance	Well ID	ZVI Observed	Nearest Injection Point/ Distance (ft)
ML-1S	Yes	IP-5 / 16 ft	ML-5D	Yes	IP-3 / 14 ft
ML-1I	Yes		ML-6S	Yes	IP-2 / 15 ft
ML-1D	Yes		ML-6I	Yes	
ML-2S	Yes	IP-4 / 10 ft	ML-6D	Yes	IP-2 / 11 ft
ML-2I	Yes		ML-7S	Yes	
ML-2D	Yes		ML-7I	Yes	
ML-3S	Yes	IP-3 / 8 ft	ML-7D	No	IP-2 / 25 ft
ML-3I	No		ML-8S	Yes	
ML-3D	No		ML-8I	Yes	
ML-4S	Yes	IP-3 / 14 ft	ML-8D	Yes	IP-5 / 40 ft
ML-4I	Yes		SBW-07	No	
ML-4D	Yes		SBW-09	No	
ML-5S	Yes	IP-3 / 14 ft	SBW-15	Yes	IP-2 / 17 ft
ML-5I	No		SBW-16	Yes	IP-4 / 17 ft

Green cells indicate ZVI was observed. Red cells indicate ZVI was not observed.

The radius of influence of the pneumatic injections was similar amongst pneumatic injection points, and is assumed to be 15-ft. Injections within the blast-enhanced bedrock trench appeared to reach the entire extent of the blast-enhanced trench that was created (i.e., up to 2.5-ft radius in width and 30-ft. radius in length). The following table includes depths of wells prior to and following injections. The most significant iron buildup was in ML-6S and ML-7S in the blast enhanced bedrock trench.

Depths of Wells

Well ID	Depth of Well (Below top of Casing) Measured During Well Development (Pre-Injections)	Depth of Well (Below top of casing) Post-Injections (11/13/17)	Change in Depth (feet)
ML-1S	30.50	30.22	0.3
ML-1I	37.50	37.23	0.3
ML-1D	44.50	44.51	0.0
ML-2S	30.40	29.41	1.0
ML-2I	38.25	35.50	2.8

Well ID	Depth of Well (Below top of Casing) Measured During Well Development (Pre-Injections)	Depth of Well (Below top of casing) Post-Injections (11/13/17)	Change in Depth (feet)
ML-2D	43.90	43.65	0.3
ML-3S	28.00	27.98	0.0
ML-3I	35.02	35.02	0.0
ML-3D	42.12	42.15	0.0
ML-4S	29.50	28.60	0.9
ML-4I	35.05	35.20	-0.2
ML-4D	42.10	42.01	0.1
ML-5S	26.95	26.71	0.2
ML-5I	34.95	34.95	0.0
ML-5D	40.90	40.80	0.1
ML-6S	29.05	25.70	3.4
ML-6I	35.90	35.91	0.0
ML-6D	42.50	42.62	-0.1
ML-7S	28.25	24.80	3.5
ML-7I	35.22	35.21	0.0
ML-7D	42.45	42.59	-0.1
ML-8S	28.28	28.30	0.0
ML-8I	35.41	35.40	0.0
ML-8D	42.55	42.59	0.0

Bold indicates decrease in well depth, assumed to be caused by iron buildup in the bottom of the well.

Within the blast-enhanced bedrock trench, ZVI was observed in all multi-level wells except ML-7D. Within the pneumatic injection area, ZVI was observed in all multi-level wells except ML-3I, ML-3D and ML-5I which were in closest proximity to IP-3. The most ZVI was observed in shallow and intermediate multi-level wells. Specifically, the most ZVI was observed in ML-7S (3.5-ft) and ML-6S (3.4-ft) within the blast-enhanced bedrock trench and ML-2I (2.8-ft) and ML-2S (1-ft) in the pneumatic injection area (closest to IP-4). Figure 6 shows the two (2) PRB areas and the inferred extent of the effective PRB based on visual observations of ZVI.

6.2 Groundwater Sampling

Baseline groundwater sampling was conducted prior to implementation of the pilot test. Three (3) rounds of groundwater sampling were conducted following the pilot test as follows:

Event	Dates	Approximate Time After Injections
Performance Monitoring Event #1	January 2-9, 2018	2 months
Performance Monitoring Event #2	February 21, 2018	3.5 months
Performance Monitoring Event #3	June 13-15, 2018	7 months
Performance Monitoring Event #4	February 26-27, 2019	15 months

Baseline Monitoring

To evaluate the performance of the pilot test, baseline and performance groundwater monitoring was completed from eight (8) wells for the following parameters.

- TCL VOCs
- Sulfate
- Sulfide
- Iron II
- Nitrate
- Nitrite
- Ethane
- Ethene
- Chloride

The following wells were sampled:

- ML-2S
- ML-2I
- ML-2D
- ML-7S
- ML-7I
- ML-7D
- LAB-SBW-15
- LAB-SBW-16

GMX-MW-3 was also sampled for VOCs during Performance Monitoring Event #4. During Performance Monitoring Event #4, analysis of all wells included VOCs only. Groundwater samples were collected using low-flow techniques with a bladder pump. Water quality parameters were collected in the field at 5 minute intervals and recorded until parameters stabilized. Low-flow sampling logs are included as Appendix 1.

Baseline sampling of LAB-SBW-15 and LAB-SBW-16 was conducted in May 2017. In addition, two (2) sets of three (3) multi-level wells (ML-2 and ML-7) were sampled in October 2017 following bedrock blasting but prior to chemical injections.

Performance Monitoring Event #1

The first round of performance monitoring was conducted from January 2-9, 2018, approximately 2 months after the ZVI injections. Due to iron build up in monitoring well ML-7S, only sample volume sufficient for VOC analysis could be collected.

VOCs

Total CVOCs increased in all wells except ML-7D which decreased by 22%. Parent compounds PCE and TCE decreased or remained non-detect in all wells except ML-2D in which the concentration of TCE increased slightly from 11 ppb to 16 ppb. Breakdown compounds cis-1,2-dichloroethene and vinyl chloride increased in all monitoring wells except ML-7D. The greatest increases of total CVOCs occurred in LAB-SBW-15 (91.16 ppb to 5,513 ppb), LAB-SBW-16 (475.17 ppb to 1,258.7 ppb), ML-2D (148.51 ppb to 516.3 ppb) and ML-7I (4,515 ppb to 15,810 ppb). In addition, CVOCs in ML-2I increased by 81% (6,250 ppb to

11,340 ppb). The increase in total CVOCs were mainly due to cis-1,2-dichloroethene and vinyl chloride which accounted for between 32% to 100% of the total CVOCs.

Although the purpose of the pilot test was to evaluate remedial options for remediation of CVOCs in groundwater, petroleum compounds were also assessed. Total BTEX (benzene, toluene, ethylbenzene, and xylenes) increased in each well except for ML-7S and ML-7D. The most significant increase in BTEX concentrations was ML-2S which increased from 6 ppb to 658 ppb.

Water Quality Parameters:

Water quality parameters including dissolved oxygen (DO) and oxidation reduction potential (ORP) were recorded in 5 minute intervals during sampling. DO decreased in all wells except SBW-15. ORP decreased in all wells. It should be noted that the DO meter was reading negative concentrations. The last positive reading recorded during purging was included on Table 2.

Other parameters including ethane, ethene, ferrous iron, nitrate, nitrite, chloride, sulfate, and sulfide were analyzed by the laboratory. Ethane and ethene increased in LAB-SBW-15 only. Sulfate decreased in all wells. Sulfide generally remained the same as baseline. Ferrous iron was non-detect in all wells except LAB-SBW-15. Nitrate and nitrite were non-detect in all wells except ML-2D and ML-7D. Chloride decreased in all wells except LAB-SBW-16.

Tabulated VOC data is included as Table 1. Tabulated water quality parameters are included as Table 2. Refer to the attached graphs for a representation of baseline versus post-injection concentrations.

Performance Monitoring Event #2

The second round of performance monitoring was conducted on February 21, 2018, approximately 6 weeks after the first round and 14 weeks after ZVI injections. Due to iron build up in monitoring well ML-7S this well could not be sampled for any parameters.

VOCs

Total CVOCs decreased in all monitoring wells from the first performance monitoring event. In comparison of CVOCs from baseline to the second performance monitoring event, total CVOCs decreased in all monitoring wells except LAB-SBW-15 (91.16 ppb to 142.4 ppb), ML-2D (148.51 ppb to 260.9 ppb) and ML-7I (4,515 ppb to 4,690 ppb). Increases in total CVOCs are a result of increases of breakdown compounds cis-1,2-dichloroethene and vinyl chloride. PCE was non-detect in all wells. TCE was detected at relatively low concentrations in ML-2D (2.9 ppb) and ML-7D (9.8 ppb) only.

Total BTEX decreased from the first to the second performance monitoring event in all wells except LAB-SBW-16 (293.8 ppb to 303 ppb) and ML-2D (5.9 ppb to 267 ppb). Total BTEX only decreased in ML-7D from baseline to the second performance monitoring event. BTEX increased from baseline to the second performance monitoring event in LAB-SBW-15 (4.7 ppb to 25.4 ppb), LAB-SBW-16 (28.6 ppb to 303 ppb), ML-2S (6 ppb to 471 ppb), ML-2I (170 ppb to 577 ppb), ML-2D (1.4 ppb to 267 ppb), and ML-7I (134 ppb to 198 ppb).

Water Quality Parameters:

DO increased from baseline to the second performance monitoring event in LAB-SBW-15 and LAB-SBW-16. DO decreased in remaining wells. It should be noted that the DO meter was reading negative concentrations. The last positive reading recorded during purging was included on Table 2. ORP decreased from baseline to the second performance monitoring event in all wells except LAB-SBW-15.

Other parameters including ethane, ethene, ferrous iron, nitrate, nitrite, chloride, sulfate, and sulfide were analyzed by the laboratory. From the baseline to the second performance monitoring event, ethane and ethene increased in ML-2I, ML-7I, and ML-7D. Ferrous iron remained non-detect. Nitrate was only detected in ML-2I and ML-7D. Nitrite remained non-detect. Chloride and sulfate decreased in all wells. Sulfide remained non-detect in all wells except LAB-SBW-15 in which it increased and LAB-SBW-16 in which it decreased to non-detect.

Tabulated VOC data is included as Table 1. Tabulated water quality parameters are included as Table 2. Refer to the attached graphs for a representation of baseline versus post-injection concentrations.

Performance Monitoring Event #3

The third round of performance monitoring was conducted from June 13-15, 2018, approximately 7 months after ZVI injections. ML-7S and ML-2S were dry and could not be sampled.

VOCs

Total CVOCs decreased in all monitoring wells from the second performance monitoring event except LAB-SBW-15 and LAB-SBW-16 which increased 205% and 98%, respectively. Total CVOCs in the second sampling event in LAB-SBW-15 were 142 ppb and in the third sampling event were 435 ppb. Total CVOCs in the second sampling event in LAB-SBW-16 were 150 ppb and in the third sampling event were 297 ppb. In comparison of CVOCs from baseline to the third performance monitoring event, total CVOCs decreased in all monitoring wells except LAB-SBW-15 which increased from 91.16 ppb to 435 ppb, or 377%; however, chloroethane (420 ppb of the total 435 ppb) accounts for a majority of CVOCs in this well. Total CVOCs have decreased most significantly from the baseline sampling event to the most recent sampling event by up to 100% in ML-2S (688 ppb to non-detect or 100%), and ML-2I (6,250 ppb to 82 ppb or 99%). ML-2I had the greatest concentration of CVOCs during the baseline sampling.

From the baseline sampling to the most recent sampling event for each well, BTEX has decreased in ML-7S, ML-7I and ML-7D within the blast-enhanced bedrock trench and increased in all other wells. The most significant increase in BTEX is in ML-2D which increased from 1.4 ppb to 136 ppb. The greatest concentration of BTEX in the third sampling event was 205 ppb in LAB-SBW-16. Free product has not been observed during pilot test sampling.

Water Quality Parameters:

DO decreased from baseline to the third performance monitoring event in all wells except ML-7D. ORP decreased from baseline to the third performance monitoring event in all wells except LAB-SBW-16.

Other parameters including ethane, ethene, ferrous iron, nitrate, nitrite, chloride, sulfate, and sulfide were analyzed by the laboratory. From the baseline to the third performance monitoring event, ethane and ethene increased in all wells except ML-2S which was non-detect for ethane and ethene. Ferrous iron increased in LAB-SBW-15 and LAB-SBW-16 and remained non-detect in all other wells. Nitrate was only detected in ML-2I and ML-7D. Nitrite was only detected in ML-7D. Chloride and sulfate decreased in all wells except ML-7I (chloride increased) and ML-7D (chloride and sulfate increased). Sulfide remained non-detect in all wells except LAB-SBW-15 in which it increased and LAB-SBW-16 in which it decreased to non-detect.

Tabulated VOC data is included as Table 1. Tabulated water quality parameters are included as Table 2. Refer to the attached graphs for a representation of baseline versus post-injection concentrations.

Performance Monitoring Event #4

The fourth round of performance monitoring was conducted from February 26-27, 2019, approximately 15 months after ZVI injections. ML-7S was dry and could not be sampled.

VOCs

Total CVOCs decreased in all monitoring wells from the prior performance monitoring event except ML-2S, ML-2I and ML-2D which increased 100%, 37% and 62%, respectively. Total CVOCs in the second sampling event in ML-2S were non-detect and in the fourth sampling event were 86 ppb. Total CVOCs in the third sampling event in ML-2I were 82 ppb and in the fourth sampling event were 113 ppb. Total CVOCs in the third sampling event in ML-2D were 68 ppb and in the fourth sampling event were 110 ppb. In comparison of CVOCs from baseline to the third performance monitoring event, total CVOCs decreased in all monitoring wells by between 15% and 98% with the exception of ML-7S which was only sampled during one performance monitoring event.

From the baseline sampling to the most recent sampling event for each well, BTEX has decreased in all wells except LAB-SBW-15, ML-2S and ML-2D. The most significant increase in BTEX is in ML-2S which increased from 6 ppb to 107 ppb. The greatest concentration of BTEX in the fourth sampling event was 118 ppb in ML-2I. Free product has not been observed during pilot test sampling.

Water Quality Parameters:

DO decreased from baseline to the fourth performance monitoring event in all wells except LAB-SBW-15 and LAB-SBW-16. ORP decreased from baseline to the fourth performance monitoring event in all wells except LAB-SBW-15 and LAB-SBW-16.

Tabulated VOC data is included as Table 1. Refer to the attached graphs for a representation of baseline versus post-injection concentrations.

The following table represents changes in concentrations of total CVOCs, parent compounds TCE and PCE, breakdown compounds cis-1,2-dichloroethene and vinyl chloride, and total BTEX. Refer to Section 7.0 for overall conclusions based on these results.

Summary of Total CVOCs During Pilot Test Performance Monitoring

Well ID	Location	Compounds	Baseline	Post-Injection Event 1	Post-Injection Event 2	Post-Injection Event 3	Post-Injection Event 4	Net Change (% change from baseline to Most Recent Sampling Event)	% change from baseline to Event #1	% change from Event #1 to Event #2	% change from Event #2 to Event #3	% change from Event #3 to Event #4

Notes:

- indicates the well was not sampled due to lack of water in the well.
 NA indicates not applicable (no change in concentration or well was not sampled).
 ND indicates non-detect.
 Red cells indicate an increase in concentration. Green cells indicate a decrease in concentration.
 Most recent sampling event refers to the last time the well could be sampled.
 Baseline data from SBW-15 and SBW-16 includes data from PDB sampling in May 2017.
 Concentrations rounded to the nearest whole number.

6.3 Quality Control

Matrix spike/ matrix spike duplicate (MS/MSD) and blind duplicate samples were collected at a rate of 1 per 20 samples or one per shipment for VOCs only. A trip blank was included with each shipment of VOCs and analyzed for TCL VOCs. VOC results were validated by a third party validator, Dataval Inc. and any modifications to the data by the validator are reflected in Table 1, attached. The remaining parameters are considered water quality parameters and were not validated. It should be noted that negative VOC results from baseline sampling (October 2017) of multi-level wells were rejected due to headspace in the VOA vials. All positive results from this sample set were qualified as estimations. No other results were rejected by the DUSRs and results were deemed technically defensible and completely usable by the validator. Data Usability Summary Reports (DUSRs) are included as Appendix 6.

6.4 Deviations to the Pilot Test Work Plan

Work was completed in general accordance with the Pilot Test Work Plan. Deviations are summarized below:

- The last injection interval (25.5-28.5-ft bgs) in IP-3 received almost twice as much iron as the other pneumatic injection intervals. The flow rate remained the same (approximately 30-40 GPM). This deviation was completed to evaluate if the formation could accept more ZVI than the 0.6% dose originally planned. Due to the sustained pressures during injection of this additional dosing it appears this interval in the formation can accept a higher dosing rate.
- The location of the blast-enhanced bedrock trench was moved slightly to the north to avoid interference with trees. The western end of the trench moved the farthest with a maximum change of approximately 10-ft north.
- During the first injection in IP-2 in the blast-enhanced bedrock trench, the top packer was mistakenly not inflated; as such, the entire open rock interval represents the injection interval for this first interval. The packers were inflated for remaining intervals.
- Due to iron buildup in ML-7S, limited sample volume only allowed for VOC analysis during the first performance monitoring event. None of the parameters could be collected during the second, third, or fourth performance monitoring event in ML-7S. Similarly, ML-2S was dry during the third performance monitoring event and could not be sampled.
- Grout was lost in the formation during installation of injection points IP-1, IP-2 and IP-5. It was difficult to get a good seal at the top of bedrock due to the fractured nature of the uppermost few feet of bedrock, in particular in the blast-enhanced bedrock trench.

7.0 Findings, Conclusions and Recommendations

The following findings, conclusions and recommendations are provided on the overall approach (PRB with ZVI) and a comparison of the two methods:

7.1 Summary of Findings

The overall findings of the pilot test are summarized below.

- 22 -

- Total CVOCs increased in all wells, except ML-7D which decreased, approximately 2 months after injections; however, parent compounds (PCE & TCE) decreased in all wells during this period except ML-2D in which TCE increased slightly. Additional details on parent compounds in comparison to degradation products are summarized below:

Parent Compounds:

PCE and TCE have decreased overall in all wells. Concentrations of PCE and TCE have decreased to non-detect in all wells except ML-2D in which TCE was 1 ppb in the fourth monitoring event, a decrease of 91% from baseline and in ML-7I in which PCE was 2.9 ppb in the fourth monitoring event (reduction of 92% from baseline) and TCE was 9.9 ppb in the fourth monitoring event (reduction of 93% from baseline). TCE exceeds Groundwater Quality Standards in ML-7I.. 1,1,1-trichloroethane (which may be a parent or breakdown compound) was detected in all wells except ML-2S during baseline and decreased in all wells to non-detect during the fourth monitoring event except in ML-2D (decreased from 7.0 to 3.8 ppb), ML-7I (decreased from 110 to 10 ppb) which remains above Groundwater Quality Standards, and ML-7D (decreased from 250 to 15 ppb), which remains above Groundwater Quality Standards. 1,1,2-trichlorotrifluoroethane was detected during baseline in LAB-SBW-15, LAB-SBW-16, ML-2I, ML-2D, ML-7I and ML-7D. Concentrations of 1,1,2-trichlorotrifluoroethane decreased in all wells, but remain above Groundwater Quality Standards in ML-7I (84 ppb).

Breakdown Compounds:

A majority of the increases in CVOCs after injections were breakdown compounds. Specifically, cis-1,2-dichloroethene and vinyl chloride were detected in all wells and accounted for 50% to 100% of the total CVOCs detected during the first monitoring event. By the fourth monitoring event, cis-1,2-dichloroethene and vinyl chloride were only detected in five (5) of the seven (7) wells sampled ranging from 5% to 95% of the total CVOCs. Concentrations of cis-1,2-dichloroethene and vinyl chloride decreased between 87% to 100% from baseline to the fourth monitoring event. Cis-1,2-dichloroethene remains above Groundwater Quality Standards in LAB-SBW-16 (6.1 ppb), ML-2S (46 ppb), ML-2I (53 ppb), and ML-7I (190 ppb). Vinyl chloride remains above Groundwater Quality Standards in LAB-SBW-16 (2.8 ppb), ML-2S (36 ppb), ML-2I (45 ppb), ML-2D (3.3 ppb), and ML-7I (170 ppb).

It should be noted that the breakdown compound 1,1-dichloroethane decreased in all wells from baseline except LAB-SBW-15 (increased from 1.72 to 3.7 ppb), ML-2D (increased from 35 to 55 ppb) which remains above Groundwater Quality Standards. In addition, breakdown compound trans-1,2-dichloroethene was detected in only two (2) wells (LAB-SBW-16 and ML-2D) and decreased to non-detect by the fourth sampling event except in ML-2D which remains at 2.1 ppb and ML-7I which remains at 7.9 ppb and above Groundwater Quality Standards. Breakdown compound chloroethane increased in ML-2D from 2.2 to 39 ppb and ML-7D from 110 to 200 ppb.

Downgradient monitoring well GMX-MW-3 was sampled in the fourth round and the only CVOCs detected above Groundwater Quality Standards were chloroethane (76 ppb), cis-1,2-dichloroethene (220 ppb), and vinyl chloride (150 ppb). Total CVOCs decreased from baseline (476 ppb) to the fourth round (452.6 ppb) by approximately 5%.

- Concentrations of total CVOCs decreased back to below baseline in all wells by the fourth monitoring event 15 months post-injections..
- Overall percent reductions in CVOCs after 15 months ranged from approximately 15% in LAB-SBW-15 downgradient of the blast enhanced bedrock trench, to approximately 98% in ML-2I within the pneumatic injection area. CVOCs in LAB-SBW-16 downgradient of the pneumatic injection area decreased by approximately 97%. The greatest total reduction in CVOCs was in both intermediate wells; ML-2I which was reduced by approximately 6,137 ppb followed by ML-7I which was reduced by approximately 3,737 ppb.
- Between baseline and the third monitoring event, ethane and ethene increased in all wells with the exception of ML-2S and ML-7D. It should be noted that ML-7D indicated increasing ethane and ethene concentrations during the initial two (2) post injection sampling events before an apparent decrease in the last event.
- Based on the results of the pilot test performance monitoring, distribution of ZVI was achieved with both injection methods as evidenced by visual observation of ZVI and pressure buildup in surrounding wells.
- Based on the soil gas screening completed prior to, during, and after the pilot test work, the pilot test had no adverse effect on methane or VOCs in soil gas.

The following subsection provides conclusions on the overall approach (PRB with ZVI) and a comparison of the two (2) injection methods.

7.2 Conclusions and Recommendations

The following general conclusions/recommendations are provided:

- ZVI appears to be effective in reducing CVOCs in groundwater associated with the P-1 Plume. ZVI can be injected at adequate volume and dosing within bedrock Zones A and B which contain a majority of the contaminant mass in both the bedrock matrix and the groundwater matrix.
- Initial increases in the concentration of contaminants were observed with both ZVI placement approaches. The increase in total CVOCs may be due to several factors:
 - Previous drilling work indicated a potential for contaminants to be displaced from bedding planes and fractures during drilling of the bedrock. Well installations, bedrock blasting, and/or ZVI injections may have moved groundwater around the bedrock zone being monitored and sampling within a short duration after well installations, bedrock blasting, and/or ZVI injections may not have allowed the bedrock zone being monitored to equilibrate.
 - The RI data indicated that bedrock matrix samples from LAB-SBW-15 and LAB-SBW-16 contained CVOCs in the rock matrix. This contaminant mass in the bedrock within and downgradient of the PRB likely contributed to increased CVOCs initially since the PRB construction disturbed the equilibrium in the

- 24 -

bedrock and may have lead to a release of some contaminants from the bedrock matrix (particularly with the enhanced bedrock trench due to the significant increase in surface area of the rock matrix due to the blasting).

- The location of any PRB in comparison to the source should consider impacts in the bedrock matrix. The pilot test PRBs considered this during the planning phase; however, based on lower groundwater concentrations and the ability to utilize existing well distribution, the pilot test PRBs were constructed north of LAB-SBW-15 and LAB-SBW-16. CVOCs in the rock matrix downgradient of the PRB will contribute to the downgradient groundwater concentrations due to back diffusion. Based on this, consideration should be given to moving the PRB south of the pilot test location.

Method Specific Conclusions/Recommendations

The following method specific conclusions/recommendations are provided:

Blast Enhanced Bedrock Trench

- PRB Area – The blasting work assumed a 2.5 ft. radius of influence (i.e., 5-ft. diameter). Measurements/observations of the area effectively blasted could not be obtained. As such, the assumed radius is utilized (note, based on extensive experience by the blasting company the blast area appears to be typical and there is little concern for any significant variation). The ZVI was observed in all locations within the trench with the exception of ML-7D. It should be noted that the shallow monitoring intervals of ML-6S and ML-7S contained significant ZVI (over 3 ft.); however, ML-8S did not have a measurable difference for the depth to bottom. Figure 6 illustrates the estimated area of the PRB. The material was easily placed within the trench via one injection point indicating an effective ‘radius’ of influence of at least 30-ft. (note, radius for the blast enhanced bedrock trench refers to the distance the material was observed to be placed laterally within the trench and is limited to the length and width of blasted bedrock trench itself). However, based on the significant amount of ZVI observed in the shallow intervals on either side of the injection point (i.e., ML-6 and ML-7) and a lack of significant ZVI in ML-8, a more conservative radius of influence of 20 to 25 ft. would be recommended for this approach.
- PRB Thickness – The RI Report indicated a groundwater velocity of 2 to 3 ft/day. The blast enhanced bedrock trench pilot test utilized a single row of blast points with an estimated 5-ft. diameter. As such, the residence time of the water flowing through the PRB is approximately 1.7 to 2.5 days. Based on the available data, complete degradation appears to be occurring (as noted by increasing concentrations of ethane and ethene in LBA-SBW-15); however, some CVOCs were still present in LBA-SBW-15. This may be a function of inadequate residence time; however, it may also be due to contaminant mass in the bedrock matrix in the area of LBA-SBW-15. As noted above, a full-scale PRB is recommended to be completed further south of the pilot PRB. This should address the potential back diffusion issues in the area of the current PRB. In this event, LaBella would recommend that the blast enhanced

bedrock trench PRB utilize the current thickness (with additional dosing noted below). Monitoring on the downgradient side would determine if any areas require re-assessment.

- Dosing Rate – This approach utilized a dosing rate of 6% (mass of ZVI amendment to mass of bedrock). There was no ‘day-lighting’ of material observed and excessive back pressure was not incurred during the injection intervals. Although ZVI was observed in all intervals, except MW-7D, additional ZVI could likely have been placed. A full scale injection via a blast enhanced bedrock trench could utilize a higher dosing rate. Although the actual amount that could be placed may vary, for planning purposes a dosing rate of 8% or 10% should be utilized.

Pneumatic Injection

- PRB Area – The pneumatic injection work assumed a 15-ft. radius of influence for each injection point. The injection work around IP-4 and IP-5 appeared to influence the multi-level wells nearest these locations (ML-1 and ML-2); however, IP-4 did not appear to influence locations to the west (IP-3 and ML-4) to the same degree as to the east. In addition, ZVI was not observed in the intermediate and deep intervals at ML-3 (i.e., ML-3I and ML-3D) which is only 8 ft. north of IP-3. Additionally, ZVI was not observed in ML-5 intermediate interval (i.e., ML-5I). This variable influence is expected in a fractured bedrock zone. Based on this, some overlapping of intervals would be recommended for a full-scale pneumatic injection. This could include a second row of injection points off-set from the initial row.
- PRB Thickness – The RI Report indicated a groundwater velocity of 2 to 3 ft/day. The pneumatic injection PRB pilot test utilized a single row of injection points with an estimated 30-ft. diameter. As such, the residence time of the water flowing through the PRB is approximately 10 to 15 days. Based on the available data, complete degradation appears to be occurring (as noted by increasing concentrations of ethane and ethene in LAB-SBW-16); however, some CVOCs were still present in LAB-SBW-16. This may be a function of inadequate residence time; however, it may also be due to contaminant mass in the bedrock matrix in the area of LAB-SBW-16. As noted above, a full-scale PRB is recommended to be completed further south of the pilot PRB. This should address the potential back diffusion issues in the area of the current PRB. Also, as noted above, overlapping injection points are recommended to ensure a continuous PRB and if completed with an additional row, this would increase the PRB thickness. Monitoring on the downgradient side would determine if any areas require re-assessment.
- Dosing Rate – This approach utilized a dosing rate of 0.6% (mass of ZVI amendment to mass of bedrock). There was no ‘day-lighting’ of material observed and excessive back pressure was not incurred during the injection intervals. ZVI was not observed in all intervals as noted above and additional ZVI could likely have been placed. A full scale pneumatic injection could utilize a higher dosing rate. Although the actual

amount that could be placed may vary, for planning purposes a dosing rate of 1% should be utilized.

Based on the results of the pilot test, in-situ chemical reduction is effective in reducing concentrations of CVOCs in groundwater on the downgradient edge of the P-1 Plume. A Feasibility Study will be completed to evaluate a full scale remedy for the P-1 Plume area.

Legend:
NL - Not Listed
NA indicates not applicable
Total VOCs - denotes summation of all detected compounds not including TICs (i.e., constituents below the detection limits are assumed to be zero).
TICs- Tentatively Indicated Compounds
Yellow highlighted values exceed NYSDEC Part 703 Groundwater Quality Standards
U - Indicates the compound was analyzed for as part of the standard list but not detected, with the detection limit shown as the value.
J - Indicates an estimated value
T- Result is a tentatively identified compound (TIC) and an estimated value
N- Presumptive evidence of material
F1- MS and/or MSD Recovery is outside acceptance limits.
** - Indicates a range approximately 5 feet above and below depth to top of pump during sampling
ML-7S not sampled during Post Injection Event 2 or 3. ML-2S not sampled during Post Injection Event 3. Wells were dry
Red text indicates a change made in the DUSR
R indicates the result was rejected in the DUSR

Legend:
NL - Not Listed
NA indicates not applicable
Total VOCs - denotes summation of all detected compounds not including TICs (i.e., constituents below the detection limits are assumed to be zero).
TICs- Tentatively Indicated Compounds
Yellow highlighted values exceed NYSDEC TOGS 1.1.1 Water Quality Standards
U - Indicates the compound was analyzed for as part of the standard list but not detected, with the detection limit shown as the value.
J - Indicates an estimated value
T- Result is a tentatively identified compound (TIC) and an estimated value
N- Presumptive evidence of material
F1- MS and/or MSD Recovery is outside acceptance limits.
** - Indicates a range approximately 5 feet above and below depth to top of pump during sampling
ML-75 not sampled during Post Injection Event 2 or 3. ML-25 not sampled during Post Injection Event 3. Wells were dry
Red text indicates a change made in the DUSR
R indicates the result was rejected in the DUSR

Legend:

H - Sample prepped or analyzed beyond specified holding time

F1 - MS and/or MSD recovery is outside acceptance limits.

ND - Indicates not detected

J - Indicates an estimated value.

NA - Not applicable

Yellow highlighted values exceed NYSDEC Part 703 Groundwater Quality Standards

** - Indicates a range approximately 5 feet above and below depth to top of pump during sampling

NS indicates not sampled

ML-7S not sampled during Post Injection Event 2 or 3. ML-2S not sampled during Post Injection Event 3. Wells were dry

Notes:
PID readings collected using a ppbRAE 3000 in parts per billion (ppb)
A reading for methane was not collected on 10/9/2017 due to a malfunction with the MultiRAE.
* Denotes the use of a Landtec Landfill Gas Meter, as opposed to a MultiRAE, to screen for methane.
Landfill Gas Meter also detects other short-chain hydrocarbons and thus methane readings may be biased high
Comparison of Landfill Gas Meter readings to analytical data results also indicate meter is biased high

**Job Narrative
480-149618-1**

Receipt

The samples were received on 3/1/2019 9:15 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 2.7° C.

GC/MS VOA

Method(s) 8260C: The following samples were collected in properly preserved vials for analysis of volatile organic compounds (VOCs). However, the pH was outside the required criteria when verified by the laboratory: ML-2I (480-149618-3), ML-7D (480-149618-5) and GMX-MW3 (480-149618-6). The sample was analyzed within 7 days per EPA recommendation.

Method(s) 8260C: The laboratory control sample (LCS) for analytical batch 480-461126 recovered outside control limits for the following analyte(s): Methyl acetate, which has been identified as a poor performing analyte when analyzed using this method; therefore, re-extraction/re-analysis was not performed. The following samples are impacted: ML-2I (480-149618-3), ML-7D (480-149618-5), GMX-MW3 (480-149618-6) and DUPE (480-149618-9).

Method(s) 8260C: The laboratory control sample (LCS) for analytical batch 480-461282 recovered outside control limits for the following analyte: Dibromochloromethane. This analyte was biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported. The following samples are impacted: ML-2D (480-149618-1), ML-2S (480-149618-2), ML-7I (480-149618-4), GMX-MW3 (480-149618-6), LAB-SBW-16 (480-149618-7), LAB-SBW-15 (480-149618-8), DUPE (480-149618-9) and TRIP BLANK (480-149618-10).

Method(s) 8260C: The continuing calibration verification (CCV) associated with batch 480-461282 recovered above the upper control limit for Dibromochloromethane. The samples associated with this CCV were non-detect above the reporting limit (RL) for the affected analyte; therefore, the data have been reported. The following samples are impacted: ML-2D (480-149618-1), ML-2S (480-149618-2), ML-7I (480-149618-4), GMX-MW3 (480-149618-6), LAB-SBW-16 (480-149618-7), LAB-SBW-15 (480-149618-8), DUPE (480-149618-9) and TRIP BLANK (480-149618-10).

Method(s) 8260C: The following samples were collected in properly preserved vials for analysis of volatile organic compounds (VOCs). However, the pH was outside the required criteria when verified by the laboratory: ML-2D (480-149618-1), ML-2S (480-149618-2), ML-7I (480-149618-4), GMX-MW3 (480-149618-6), LAB-SBW-16 (480-149618-7), LAB-SBW-15 (480-149618-8) and DUPE (480-149618-9). The sample was analyzed within 7 days per EPA recommendation.

Method(s) 8260C: The following samples were diluted to bring the concentration of target analytes within the calibration range: ML-2D (480-149618-1), ML-7I (480-149618-4), GMX-MW3 (480-149618-6) and DUPE (480-149618-9). Elevated reporting limits (RLs) are provided.

Method(s) 8260C: The following volatiles samples were diluted due to foaming at the time of purging during the original sample analysis: ML-2S (480-149618-2), LAB-SBW-16 (480-149618-7) and LAB-SBW-15 (480-149618-8). Elevated reporting limits (RLs) are provided.

Method(s) 8260C: The following volatile sample was analyzed with significant headspace in the sample container(s): GMX-MW3 (480-149618-6). Significant headspace is defined as a bubble greater than 6 mm in diameter.

Method(s) 8260C: The following sample was diluted to bring the concentration of target analytes within the calibration range: ML-7D (480-149618-5). Elevated reporting limits (RLs) are provided.

Method(s) 8260C: The following volatiles sample was diluted due to foaming at the time of purging during the original sample analysis: ML-2I (480-149618-3). Elevated reporting limits (RLs) are provided.

Method(s) 8260C: Due to the coelution of Ethyl Acetate with 2-Butanone in the full spike solution, these analytes exceeded control limits in the laboratory control sample (LCS) associated with analytical batch 480-461282. The following samples were affected: ML-2D (480-149618-1), ML-2S (480-149618-2), ML-7I (480-149618-4), GMX-MW3 (480-149618-6), LAB-SBW-16 (480-149618-7), LAB-SBW-15 (480-149618-8), DUPE (480-149618-9) and TRIP BLANK (480-149618-10).

Method(s) 8260C: The following samples were collected in properly preserved vials for analysis of volatile organic compounds (VOCs). However, the pH was outside the required criteria when verified by the laboratory: LAB-SBW-15 (480-149618-8[MS]) and LAB-SBW-15 (480-149618-8[MSD]). The sample was analyzed within 7 days per EPA recommendation.

Method(s) 8260C: The following volatiles samples were diluted due to foaming at the time of purging during the original sample analysis: LAB-SBW-15 (480-149618-8[MS]) and LAB-SBW-15 (480-149618-8[MSD]). Elevated reporting limits (RLs) are provided.

Method(s) 8260C: The following volatile samples were analyzed with significant headspace in the sample container(s): LAB-SBW-15 (480-149618-8[MS]) and LAB-SBW-15 (480-149618-8[MSD]). Significant headspace is defined as a bubble greater than 6 mm in diameter.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

TestAmerica Job ID: 480-149618-1

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
*	LCS or LCSD is outside acceptance limits.
E	Result exceeded calibration range.
F1	MS and/or MSD Recovery is outside acceptance limits.

GC/MS VOA TICs

Qualifier	Qualifier Description
J	Indicates an Estimated Value for TICs
N	Presumptive evidence of material.
T	Result is a tentatively identified compound (TIC) and an estimated value.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
α	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Accreditation/Certification Summary

Client: LaBella Associates DPC
Project/Site: Former Emerson Street Landfill Project

TestAmerica Job ID: 480-149618-1

Laboratory: TestAmerica Buffalo

The accreditations/certifications listed below are applicable to this report.

Authority	Program	EPA Region	Identification Number	Expiration Date
New York	NELAP	2	10026	03-31-19 *

* Accreditation/Certification renewal pending - accreditation/certification considered valid.

Method 8260C

Volatile Organic Compounds (GC/MS)
by Method 8260C

Question	Answer	Comment
Radioactivity either was not measured or, if measured, is at or below background	True	
The cooler's custody seal, if present, is intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	Received Trip Blank(s) not listed on COC.
Samples are received within Holding Time (Excluding tests with immediate HTs)..	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
If necessary, staff have been informed of any short hold time or quick TAT needs	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Sampling Company provided.	True	LABELLA
Samples received within 48 hours of sampling.	True	
Samples requiring field filtration have been filtered in the field.	N/A	
Chlorine Residual checked.	N/A	

ANALYTICAL REPORT

Job Number: 480-126300-1

Job Description: Former Emerson Street Landfill Project

For:
LaBella Associates DPC
300 State Street
Suite 201
Rochester, NY 14614
Attention: Ann Aquilina

Approved for release.
Melissa L Deyo
Project Manager I
1/10/2018 2:34 PM

Melissa L Deyo, Project Manager I
10 Hazelwood Drive, Amherst, NY, 14228-2298
(716)504-9874
melissa.deyo@testamericainc.com
01/10/2018

The test results in this report meet all NELAP requirements for analytes for which accreditation is required or available. Any exceptions to the NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory. All questions regarding this test report should be directed to the TestAmerica Project Manager who has signed this report.

Comments

No additional comments.

Receipt

The samples were received on 10/21/2017 8:45 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 1.7° C.

Receipt Exceptions

The following samples (-01, -02, -03) were received outside of holding time for Nitrate Series and Ferrous Iron analyses.

All samples for 8260 and RSK analyses were received with headspace.

GC/MS VOA

Method(s) 8260C: The sample was collected in properly preserved vials for analysis of volatile organic compounds (VOCs). However, when verified by the laboratory, the pH was greater than 2 and the following samples were analyzed after 7 days from sampling: ML-2S (480-126300-1), ML-2I (480-126300-2), ML-2I (480-126300-2[MS]), ML-2I (480-126300-2[MSD]) and DUPLICATE (480-126300-7).

Method(s) 8260C: The continuing calibration verification (CCV) associated with batch 480-384727 recovered outside acceptance criteria, low biased, for 4-Methyl-2-pentanone and Methyl-t-Butyl Ether (MTBE). A reporting limit (RL) standard was analyzed, and the target analyte was detected. Since the associated samples were non-detect for this analyte, the data have been reported. The following samples are impacted: ML-2S (480-126300-1), ML-2I (480-126300-2), ML-2D (480-126300-3) and DUPLICATE (480-126300-7).

Method(s) 8260C: The laboratory control sample and/or the laboratory control sample duplicate (LCS/LCSD) for analytical batch 480-384727 recovered outside control limits for the following analyte(s): Methyl acetate. Methyl acetate has been identified as a poor performing analyte when analyzed using this method; therefore, re-extraction/re-analysis was not performed. The following samples are impacted: ML-2S (480-126300-1), ML-2I (480-126300-2), ML-2D (480-126300-3) and DUPLICATE (480-126300-7).

Method(s) 8260C: The following samples were diluted to bring the concentration of target analytes within the calibration range: ML-2S (480-126300-1), ML-2I (480-126300-2), ML-2I (480-126300-2[MS]), ML-2I (480-126300-2[MSD]), ML-2D (480-126300-3) and DUPLICATE (480-126300-7). Elevated reporting limits (RLs) are provided.

Method(s) 8260C: The following samples were diluted to bring the concentration of target analytes within the calibration range: ML-7I (480-126300-5), ML-7D (480-126300-6), (480-126300-F-5 MS) and (480-126300-F-5 MSD). Elevated reporting limits (RLs) are provided.

Method(s) 8260C: The following volatiles sample was diluted due to foaming at the time of purging during the original sample analysis: ML-7S (480-126300-4). Elevated reporting limits (RLs) are provided.

Method(s) 8260C: The continuing calibration verification (CCV) associated with batch 480-384962 recovered outside acceptance criteria, low biased, for 4-Methyl-2-pentanone (MIBK) and Methyl tert-butyl ether. A reporting limit (RL) standard was analyzed, and the target analyte was detected. Since the associated samples were non-detect for this analyte, the data have been reported. The following samples are impacted: ML-7S (480-126300-4), ML-7I (480-126300-5), ML-7D (480-126300-6) and TRIP BLANK (480-126300-8).

Method(s) 8260C: The sample was collected in properly preserved vials for analysis of volatile organic compounds (VOCs). However, when verified by the laboratory, the pH was greater than 2 and the following sample was analyzed after 7 days from sampling: ML-7S (480-126300-4).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC VOA

Method(s) RSK-175: The following sample were collected in properly preserved vials for analysis of volatile organic compounds (VOCs). However, the pH was outside the required criteria when verified by the laboratory, and corrective action was not possible: ML-2S (480-126300-1), ML-2I (480-126300-2), ML-7S (480-126300-4) and ML-7D (480-126300-6).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry

Method(s) SM 3500 FE D: This analysis is normally performed in the field and has a method-defined holding time of 15 minutes. The following samples has been qualified with the "HF" flag to indicate analysis was performed in the laboratory outside the 15 minute timeframe: ML-2S (480-126300-1), ML-2I (480-126300-2), ML-2D (480-126300-3), ML-7S (480-126300-4), ML-7I (480-126300-5) and ML-7D (480-126300-6).

Method(s) 353.2: The following samples was received outside of holding time: ML-2S (480-126300-1), ML-2I (480-126300-2) and ML-2D (480-126300-3).

Method(s) 353.2: The following samples was filtered prior to analysis. ML-2S (480-126300-1), ML-2I (480-126300-2) and ML-7S

(480-126300-4)

Method(s) 353.2: The following sample(s) was received with less than 2 days remaining on the holding time or less than one shift (8 hours) remaining on a test with a holding time of 48 hours or less. As such, the laboratory had insufficient time remaining to perform the analysis within holding time: ML-7I (480-126300-5).

Method(s) 353.2: The following sample was filtered prior to analysis: ML-7I (480-126300-5)

Method(s) 353.2: The following sample was filtered prior to analysis: ML-7I (480-126300-5)

Method(s) 353.2: The following samples was received outside of holding time: ML-2S (480-126300-1), ML-2I (480-126300-2) and ML-2D (480-126300-3).

Method(s) Nitrate by calc: The following sample(s) was received with less than 2 days remaining on the holding time or less than one shift (8 hours) remaining on a test with a holding time of 48 hours or less. As such, the laboratory had insufficient time remaining to perform the analysis within holding time: ML-2S (480-126300-1), ML-2I (480-126300-2) and ML-2D (480-126300-3).

Method(s) Nitrate by calc: The following sample(s) was received with less than 2 days remaining on the holding time or less than one shift (8 hours) remaining on a test with a holding time of 48 hours or less. As such, the laboratory had insufficient time remaining to perform the analysis within holding time: ML-7I (480-126300-5).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

TestAmerica Buffalo

Method Summary

Client: LaBella Associates DPC
Project/Site: Former Emerson Street Landfill Project

TestAmerica Job ID: 480-126300-1

Method	Method Description	Protocol	Laboratory
8260C	Volatile Organic Compounds by GC/MS	SW846	TAL BUF
RSK-175	Dissolved Gases (GC)	RSK	TAL BUF
353.2	Nitrate	EPA	TAL BUF
SM 3500 FE D	Iron, Ferrous and Ferric	SM	TAL BUF

Definitions/Glossary

Client: LaBella Associates DPC
Project/Site: Former Emerson Street Landfill Project

TestAmerica Job ID: 480-126300-1

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
*	LCS or LCSD is outside acceptance limits.
F1	MS and/or MSD Recovery is outside acceptance limits.

GC/MS VOA TICs

Qualifier	Qualifier Description
J	Indicates an Estimated Value for TICs
T	Result is a tentatively identified compound (TIC) and an estimated value.

General Chemistry

Qualifier	Qualifier Description
H	Sample was prepped or analyzed beyond the specified holding time
HF	Field parameter with a holding time of 15 minutes. Test performed by laboratory at client's request.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
α	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Quality Control Limits

LCS/CCV = 1.5mg/L
 Control Limits = 90-110%
 (1.35 mg/L - 1.65 mg/L)

MB/CCB = 0.0mg/L
 Control Limits <0.05mg/ >-0.05mg/L

MS/MSD = 1.0mg/L
 Control Limits = 90-110%
RPD Control Limits <20%

Nitrate/Nitrite Calibration curve:

- 3.0ppm - 150ul of 1000ppm Nitrate/Nitrite up to 50ml with DI water
- 2.0ppm - 100ul of 1000ppm Nitrate/Nitrite up to 50ml with DI water
- 1.0 ppm - 50ul of 1000ppm Nitrate/Nitrite up to 50ml with DI water
- .5ppm - 5ml of 1.0ppm up to 10ml with DI water
- .2 ppm - 5ml of 2.0ppm up too 50ml with DI water
- .05 ppm - 5ml of .2ppm up 20ml With DI water
- ICV- 150ul of second source 1000ppm Nitrate/Nitrite standard up too 100 ml with DI
- CCVL - .05 ppm - 5ml of .2ppm up 20ml With DI water

Nitrite Calibration curve:

- 3.0ppm - 150ul of 1000ppm Nitrite up to 50ml with DI water
- 2.0ppm - 100ul of 1000ppm Nitrite up to 50ml with DI water
- 1.0 ppm - 50ul of 1000ppm Nitrite up to 50ml with DI water
- .5ppm - 5ml of 1.0ppm up to 10ml with DI water
- .2 ppm - 5ml of 2.0ppm up too 50ml with DI water
- .05 ppm - 5ml of .2ppm up 20ml With DI water
- ICV- 150ul of second source 1000ppm Nitrite standard up too 100 ml with DI
- CCVL - .05 ppm - 5ml of .2ppm up 20ml With DI water

Login Number: 126300
List Number: 1
Creator: Kinecki, Kenneth P

List Source: TestAmerica Buffalo

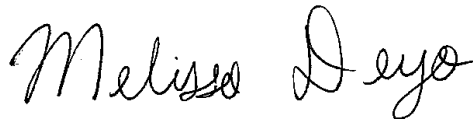

Question	Answer	Comment
Radioactivity either was not measured or, if measured, is at or below background	True	
The cooler's custody seal, if present, is intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time (Excluding tests with immediate HTs)..	False	Nitrate Series and Ferrous - samples -01, -02, -03
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	False	All vials have headspace
If necessary, staff have been informed of any short hold time or quick TAT needs	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Sampling Company provided.	True	Labella
Samples received within 48 hours of sampling.	True	
Samples requiring field filtration have been filtered in the field.	N/A	
Chlorine Residual checked.	N/A	

ANALYTICAL REPORT

Job Number: 480-129748-2

Job Description: Former Emerson Street Landfill Project

For:
LaBella Associates DPC
300 State Street
Suite 201
Rochester, NY 14614
Attention: Ann Aquilina

Approved for release.
Melissa L Deyo
Project Manager I
1/9/2018 4:01 PM

Melissa L Deyo, Project Manager I
10 Hazelwood Drive, Amherst, NY, 14228-2298

Receipt

The samples were received on 1/5/2018 11:00 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 2.0° C.

GC/MS VOA

Method(s) 8260C: The following samples were collected in properly preserved vials for analysis of volatile organic compounds (VOCs). However, the pH was outside the required criteria when verified by the laboratory, and corrective action was not possible: ML-2S (480-129748-4), (480-129748-K-4 MS) and (480-129748-K-4 MSD). The samples were analyzed within 7 days per EPA recommendation.

Method(s) 8260C: The continuing calibration verification (CCV) associated with batch 480-394701 recovered above the upper control limit for Carbon tetrachloride, Tetrachloroethene, 1,1,1-Trichloroethane, 1,1,2-Trichloro-1,2,2-trifluoroethane and trans-1,2-Dichloroethene. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The following sample is impacted: ML-2S (480-129748-4).

Method(s) 8260C: The following samples were diluted to bring the concentration of target analytes within the calibration range: ML-2S (480-129748-4), (480-129748-K-4 MS) and (480-129748-K-4 MSD). Elevated reporting limits (RLs) are provided.

Method(s) 8260C: The continuing calibration verification (CCV) associated with batch 480-394763 recovered above the upper control limit for Acetone and 2-Butanone (MEK). The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The following samples are impacted: LBA-SBW-15 (480-129748-1), DUPE (480-129748-2) and LBA-SBW-16 (480-129748-3).

Method(s) 8260C: The laboratory control sample (LCS) for analytical batch 480-394763 recovered outside control limits for the following analytes: Acetone. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported. The following samples are impacted: LBA-SBW-15 (480-129748-1), DUPE (480-129748-2) and LBA-SBW-16 (480-129748-3).

Method(s) 8260C: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for analytical batch 480-394763 were outside control limits. The data has been qualified and reported.

Method(s) 8260C: The following samples were diluted to bring the concentration of target analytes within the calibration range: LBA-SBW-15 (480-129748-1), LBA-SBW-15 (480-129748-1[MS]), LBA-SBW-15 (480-129748-1[MSD]), DUPE (480-129748-2) and LBA-SBW-16 (480-129748-3). Elevated reporting limits (RLs) are provided.

Method(s) 8260C: The following samples were collected in properly preserved vials for analysis of volatile organic compounds (VOCs). However, the pH was outside the required criteria when verified by the laboratory, and corrective action was not possible: LBA-SBW-15 (480-129748-1), LBA-SBW-15 (480-129748-1[MS]), LBA-SBW-15 (480-129748-1[MSD]), DUPE (480-129748-2) and LBA-SBW-16 (480-129748-3). The sample was analyzed within 7 days per EPA recommendation.

Method(s) 8260C: The following samples was diluted to bring the concentration of target analytes within the calibration range: ML-2I (480-129748-5) and ML-2D (480-129748-6). Elevated reporting limits (RLs) are provided.

Method(s) 8260C: The continuing calibration verification (CCV) associated with analytical batch 480-394793 recovered above the upper control limit for 2-Butanone and Acetone. These analytes were not detected above their reporting limit (RLs) in the associated samples; therefore, the data have been reported. The following samples are impacted: ML-2I (480-129748-5) and ML-2D (480-129748-6).

Method(s) 8260C: The laboratory control sample (LCS) for analytical analytical batch 480-394793 recovered outside control limits for the following analyte: Acetone. This analyte was biased high in the LCS and were not detected above the reporting limit (RLs) in the associated samples; therefore, the data have been reported. The following samples are impacted: ML-2I (480-129748-5) and ML-2D (480-129748-6).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
*	LCS or LCSD is outside acceptance limits.
F1	MS and/or MSD Recovery is outside acceptance limits.

GC/MS VOA TICs

Qualifier	Qualifier Description
J	Indicates an Estimated Value for TICs
N	Presumptive evidence of material.
T	Result is a tentatively identified compound (TIC) and an estimated value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
α	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
