## **1.0 INTRODUCTION**

Day Environmental, Inc. (DAY) prepared this Pre-Development Phase II Environmental Site Assessment (ESA) and Geotechnical Study Report in support of the contemplated redevelopment of the subject property located within the Sub-Area North portion of the Bulls Head Brownfield Opportunity Area (BOA), Rochester, New York.

Fieldwork associated with this Phase II ESA was conducted on City-owned parcels addressed as: 796-800 and 816-822 Brown Street; 886, 888-892, 894-898, 900, and 906-910 West Main Street; 44, 64, 68-70 and 76 York Street; and 7 and 17 York Street. Under temporary incident of ownership (TIO), confirmatory Phase II ESAs were previously completed on parcels addressed as 5 Kensington and 50 York Street, which are currently owned by the City. For the purposes of this report, and unless stated otherwise, the findings, conclusions and recommendations described herein, and references to the “Site”, pertain only to the above-listed City-owned parcels. [Note: 239 Silver Street, 21 Kensington Street, and 904 West Main Street are also currently owned by the City, but were not included in the Phase II ESA.]

A Project Locus Map is included as Figure 1, a topographic Survey of the Site is included as Figure 2A, and a Site Plan showing the City-owned parcels within the Bulls Head BOA is included as Figure 2B. The work presented herein was completed in accordance with DAY’s January 2, 2018 proposal to the City of Rochester (City).

### **1.1 Site Background and History**

The Site consists of contiguous and non-contiguous undeveloped lots, former paved streets and parking lots and landscaped areas with trees and grass. The Site is bounded to the east by Kensington Street, to the west by York Street, to the south by West Main Street and Brown Street, and to the north by Silver Street and Danforth Street. The Site is located in a mixed residential and commercial developed area.

Historical Sanborn maps dated 1892, 1912, 1950, 1959 and 1971, were reviewed as part of this project. Figure 3 and Figures 3A through 3E provide an overlay of the Site parcels and project test locations in relation to 2015 aerial imagery, the 1892 Sanborn map, the 1912 Sanborn map, the 1950 Sanborn map, the 1959 Sanborn map, and the 1971 Sanborn map, respectively. The historical maps show that the Site and the two TIO properties were developed for various uses over the years, but in general consisted of a co-mingled residential neighborhood and commercial/light industrial area (refer to Section 1.2 for further information).

Potential concerns associated with the Site, and adjacent off-site parcels (e.g.: gas station; collision repair shop; heating, ventilation, and air conditioning contractor), include the contamination of soil and/or groundwater if leaks/spills and/or improper handling/disposal of hazardous materials, petroleum products and/or hazardous wastes have occurred. Due to the prevalence of oil as a heating fuel at the adjacent off-site parcels and former site buildings, it is plausible that oil tanks are/were present in current and former buildings within, or in proximity to, the Site. Table 1 provides a summary of previous identified recognized environmental concerns (RECs) (if any), demolition details (if applicable and available) and notes related to real or potential environmental impact sources for 12 of the City-owned parcels.

DAY and its geotechnical subconsultant (Foundation Design, P.C.) reviewed various in-house documents and resources. DAY and Foundation Design, P.C. also reviewed historical maps, photos and figures provided by the City. This document review provided useful information concerning anticipated subsurface site conditions, (i.e., locations of former building foundations, adjoining gas station properties, etc.) and this information was used to assist in the planning and evaluation of this study. Test locations were selected based on the historical use of the individual parcels with the intent to evaluate specific concerns related to on-site and/or off-site historical activities, fill material, and/or to provide general site coverage.

## **1.2 Summary of Previous Environmental Reports**

DAY completed a September 2009 “Environmental Screen, Bulls Head Project Area (103 Contiguous Parcels of Land), Rochester, New York” that summarized the findings of the historical records reviewed and site visits from public right-of-way (ROW) and city-owned parcels for most of the parcels that comprise the Site. DAY completed Phase I ESAs at the following City-Owned properties within the Site: 886 West Main Street (2015); 894-898 West Main Street (2016); 42 York Street (2016); 68-70 York Street (2016); 5 Kensington Street (2017); and 50 York Street (2017), Rochester, New York. In 2017, DAY also completed Confirmatory Phase II Environmental Site Assessments for 50 York Street and 5 Kensington Street, Rochester, New York.

### *Environmental Screen, Bulls Head Project Area (103 Contiguous Parcels of Land), Rochester, New York*

As presented in the 2009 Environmental Screen, Bulls Head Project Area report, historical uses of the City-owned parcels that comprise the Site have included residential and various commercial and industrial purposes. Specific uses include, but are not limited to: private residences, laundry facilities (possible dry cleaner), textile manufacturing, paint center, hardware store (with permit for flammable liquid storage), automobile service/repair, industrial/manufacturing use, and automobile storage. TIO property 50 York Street was occupied by a “paint washer”, a furniture shop, an upholsterer, a collision shop and an auto service facility during its operational history. TIO property 5 Kensington Street was used as a workshop and auto repair facility.

Based on historical data, the Environmental Screen report presumed that the Site subsurface would be characterized by old foundation remnants and heterogeneous fill materials above natural soils. The report concluded that it was unknown whether potential fill material would contain constituents of concern [i.e., volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), metals, poly-chlorinated biphenyls (PCBs), etc.], and if present, whether the concentrations represented a concern for redevelopment at the Site. It was also unknown whether potential fill materials and subsurface conditions at the Site would pose additional costs in relation to geotechnical considerations during redevelopment of the Site.

*Phase I Environmental Site Assessments, Bulls Head Site, Rochester, New York.*

As presented in the Phase I ESA reports, the following on-site recognized environmental conditions (RECs) were identified for the following properties:

886 West Main Street

- Three floor drains in the basement, a pipe of unknown purpose in the elevator shaft and the potential existence of floor drains in the elevator shaft.
- A cut-off vent pipe with an unknown purpose located on the west exterior wall of the building.
- Historical uses of the property including paint shop, an oil house, a potential shooting range and textile corporation.

894-898 West Main Street

- Historical uses of the property including the apparent presence/former presence of an incinerator, storage of motorcycles, motor oil, tires, gasoline in tanks etc. and improper storage of combustible materials.

42 York Street

- Historical uses of the property including the apparent storage of vehicles. In addition, apparent dark staining and miscellaneous items, which may be indicative of debris appear to be located throughout this property. The staining and debris on this property may be indicative of current or former industrial/manufacturing use of the property or affects from surrounding properties.

No on-site RECs were identified for the 68-70 York Street parcel.

In addition, the Phase I ESA reports for 68-70 York Street, 886 West Main Street, 894-898 Main Street and 42 York Street also contained the following off-site REC:

- Historical Uses and Regulatory Listing of Adjoining/Nearby Properties including:
  - Potential infrastructure (i.e., vent and/fill pipe associated with a potential UST) on a parcel (i.e., 66-67 York Street) adjacent to the Site.
  - A Federal Brownfield Site located approximately 0.2 miles south/southeast of the Site.
  - Approximately seven spill incidents on privately owned parcels within the site boundaries.
  - A Voluntary Cleanup Program Site adjacent to the Site
  - One or more inactive spills on parcels near or adjacent to the Site.

## *5 Kensington Street Phase I ESA and Confirmatory Phase II Environmental Site Assessment*

DAY completed a Phase I ESA at 5 Kensington Street, Rochester, New York with funding from the New York State Brownfield Opportunity Area (BOA) site assessment program and the Environmental Protection Agency (EPA). The Phase I ESA identified the following RECs:

- Historical uses of the property / Potential Underground Storage Tank including the property being used as a workshop and auto repair facility.
- Historical uses and regulatory listings of adjoining/nearby properties

As presented in the Confirmatory Phase II Environmental Site Assessment Report for 5 Kensington Street dated January 11, 2018, limited intrusive studies were completed on the parcel to evaluate the current environmental conditions. The limited studies included a geophysical survey, advancement of four test borings and analytical laboratory testing of four soil samples collected from the parcel.

The geophysical survey completed on the parcel did not detect the presence of underground storage tanks (USTs), but did identify possible former building foundations approximately 3 feet (ft.) below ground surface (bgs).

Soil samples were collected from the four testing borings, which started at or near the ground surface and extended to depths ranging between 11.0 ft. and 14.5 ft. bgs where equipment refusal was encountered. Visual observation and photoionization detector (PID) screening of the samples did not identify field evidence of chemical or petroleum impact. Fill material consisted of reworked soil with varying amounts of ash and/or cinders. A prevalent layer of ash/cinder fill (i.e., greater than 0.5 feet in thickness) was observed in three of the four test borings completed, and this ash/cinder fill could be subject to solid waste regulations if disturbed, displaced, etc. Refer to Figure 4 for the location of the test borings advanced on 5 Kensington Street and those locations in which the prevalent layer of ash/cinder fill was observed.

Analytical laboratory testing detected one or more volatile organic compounds (VOCs) in each soil sample, but measured concentrations were below their respective Unrestricted Use Soil Cleanup Objectives (UUSCOs), Residential SCOs (RSCOs), Restricted Residential SCOs (RRSCOs), Commercial SCOs (CSCOs), and Protection of Groundwater SCOs (PGWSCOs). One semi-volatile organic compound (SVOC) in one sample was detected at a concentration exceeding its UUSCO, RSCO, and RRSCO, but not its CSCO. Mercury was detected in three of the four soil samples at concentrations that exceeded one or more of its UUSCO, RSCO, RRSCO, or PGWSCO, but was not measured at a concentration that exceeded its CSCO. Arsenic, lead and silver were detected in one or more soil samples at concentrations that exceeded their UUSCOs, but not their respective RSCOs, RRSCOs, PGWSCOs or CSCOs. The samples with the highest exceedances of one or more SCOs were collected from fill material with higher amounts of apparent ash and/or coal. The polychlorinated biphenyl (PCB) Aroclor-1260 was detected in a soil sample at a concentration that exceeded its UUSCO, but not its respective RSCO, RRSCO, PGWSCO or CSCO.

## *50 York Street Phase I ESA and Confirmatory Phase II Environmental Site Assessment*

DAY completed a Phase I ESA at 50 York Street, Rochester, New York with funding from the NYSBOA site assessment program and the EPA. The Phase I ESA identified the following RECs:

- Historical uses of the property / including the property being occupied by a “paint washer”, a furniture shop, an upholsterer, a collision shop and an auto service facility during its operational history.

As presented in the Confirmatory Phase II Environmental Site Assessment Report for 50 York Street dated January 11, 2018, limited intrusive studies were completed on the parcel to evaluate the current environmental conditions. The limited intrusive studies included a geophysical survey, advancement of four test borings, and analytical laboratory testing of four soil samples collected from the parcel.

The geophysical survey completed on the parcel did not detect the presence of USTs. In addition, a “pipe of unknown use” was determined to run north of the building and extend into the York Street public ROW. Based on yellow utility marking at this portion of York Street, it is possible this pipe is associated with the natural gas service for the building on the parcel.

Soil samples were collected from the four testing borings, which started at or near the ground surface and extended to depths ranging between 6.0 ft and 8.7 ft. bgs where equipment refusal was encountered. Visual observation and PID screening of the samples did not identify field evidence of chemical or petroleum impact. Fill material consisted of reworked soil with de minimis amounts of ash and/or coal

Analytical laboratory testing did not detect PCBs above the laboratory method detection limits and the VOCs and SVOCs that were detected were below their respective UUSCOs, RSCOs, RRSCOs, CSCOs and PGWSCOs. Lead and/or Mercury were detected in three samples at concentrations that exceeded the RRSCOs. The samples with the highest exceedances of one or more Soil Cleanup Objectives (SCOs) were collected from fill material.

Previously generated Confirmatory Phase II ESA information and data (i.e., tested constituent concentrations, soil types and thicknesses, etc.) for 5 Kensington Street and 50 York Street were incorporated into the data sets discussed herein. Refer to the excerpts included in Appendix A for specific information associated with the 50 York Street and 5 Kensington Street parcels.

### **1.3 Future Redevelopment**

The City is considering redevelopment options for the Site, which are presumed to consist of primarily commercial re-use, but may also include some mixed residential and commercial uses.

## **1.4 Objective of Study**

The objective of the scope of work performed during this project was to complete a Phase II ESA and evaluate subsurface conditions with regard to environmental and geotechnical characteristics, in order to provide information and guidance for use in the redevelopment of the Site.

## **1.5 Scope of Work**

To assist in meeting the objective of this project, the following scope of work was performed:

- Geophysical survey of select parcels;
- Concurrent subsurface environmental and geotechnical assessment involving excavation of test pits, advancement and sampling of rotary-drilled and direct-push test borings, installation of groundwater monitoring wells, and analysis of soil and groundwater samples;
- Location and elevation survey of the subsurface test locations; and
- Development of this Pre-Development Phase II ESA and Geotechnical Study Report.

The scope of work performed is further described in Section 2.0 of this report.

## **2.0 PRE-DEVELOPMENT ENVIRONMENTAL AND GEOTECHNICAL SCOPE OF WORK**

This section of the report provides details regarding the scope of work that was implemented to fulfill the objective of the study described in Section 1.4.

### **2.1 Geophysical Survey**

On February 1, 2018, DAY's subconsultant Ground Penetrating Radar Systems, Inc. (GPRS) performed a GPR geophysical survey over select portions of the Site including 796-800 Brown Street, 816-822 Brown Street, a portion of 886 West Main Street, 904 West Main Street and 906-910 West Main Street to assist in evaluating the presence of buried metallic objects (e.g., abandoned USTs and/or associated piping, drums, etc.) and remnants of former foundations/structures. Refer to Figure 2B for 2015 aerial imagery of the parcels in which the geophysical survey was completed and the identified anomalies associated with the geophysical study. A copy of GPRS' report dated February 23, 2018 is included in Appendix B. As depicted in the GPRS report and on Figure 2B, four anomalies were identified at the Site including: an apparent utility line, a suspect foundation or layer of buried asphalt, and two locations of buried debris. Anomalies representative of USTs, buried drums, or other environmental concerns were not located in the areas surveyed by GPRS. The information obtained from the geophysical survey was taken into consideration during selection of the test pits and test boring locations that were completed as part of this pre-development study. The maximum effective depth of the GPR for the portions of the Site that were surveyed was 6.5 ft. bgs. The average penetration depth throughout the areas surveyed was approximately 4-4.5 ft bgs.

### **2.2 Subsurface Soil/Fill Evaluation**

Intrusive investigative work was performed as part of a concurrent environmental and geotechnical subsurface evaluation for the Site. This subsurface evaluation included the advancement of 24 direct-push test borings, the excavation of 25 test pits, the advancement of 12 rotary-drilled test borings, the installation of eight monitoring wells in the rotary-drilled test borings, and the collection, field screening, field observation, and environmental laboratory analysis of soil and groundwater samples. Additional details concerning the subsurface evaluation work are provided in the subsections below.

DAY used a Trimble Geo 7X model Geographic Positioning System (GPS) to mark-out, and later re-measure, the location of each test pit and test boring advanced during this study. Further, the elevation of each monitoring well was surveyed by the City in relation to the Rochester City datum.

#### 2.2.1 Direct-Push Test Borings

DAY retained Nature's Way Environmental Consultants & Contractors, Inc. (Nature's Way) to install 24 direct-push test borings at the Site using vehicle-mounted drilling equipment. Nature's Way advanced these test borings on February 12, 2018 and February 13, 2018. The locations are shown on Figure 3, and Figure 3A through Figure 3E. Criteria used in the selection of the test boring locations included:

1. Locations that may be impacted by adjoining private properties;

2. Locations of selected RECs (i.e., historic uses of the Site and adjoining properties, and active spills on presumed upgradient properties within a 0.5-mile radius of the Site, etc.), and
3. Consultation with the geotechnical engineer to provide general site coverage to characterize subsurface conditions and address significant data gaps.

During drilling, soil samples were collected in up to four-foot increments from the ground surface to the depth where equipment refusal was encountered on bedrock, buried foundations or debris. The soil samples retained were classified, logged, and also screened with the PID. Equipment refusal was encountered in the test borings at depths ranging between 3.0 (TB-20) ft. and 15.8 (TB-10) ft. bgs. Personnel from DAY and Foundation Design, P.C. observed and prepared a subsurface log of the test borings. DAY screened the soil/fill samples with a PID for evidence of VOC impact, and collected select samples for possible laboratory analysis. Selected soil samples were retained for possible environmental analytical laboratory testing. Pertinent information for each test boring is provided on logs included in Appendix C.

### 2.2.2 Test Pits

DAY retained Nature's Way to advance 25 test pits at the Site on February 15, 2018, February 16, 2018 and April 20, 2018. The locations of these test pits (designated as TP-01 through TP-25) are shown on Figure 3 and Figure 3A through Figure 3E. Criteria used in the selection of these test pit locations included:

- 1) Results of the geophysical survey (i.e.: a test pit was excavated at the location of a geophysical anomaly suspected to be a foundation or layer of buried asphalt);
- 2) Former building locations to evaluate backfill, and
- 3) Consultation with the geotechnical engineer to provide general site coverage to characterize subsurface conditions.

Some of the test pit locations were also useful in evaluating the areal and vertical extent of fill material, early equipment refusals, or other subsurface conditions that were encountered as the work progressed.

The test pits were excavated to depths ranging between 3.5 feet (TP-15) and 10.0 feet (TP-2, TP-3 and TP-20) bgs. Personnel from DAY and Foundation Design, P.C. observed the excavations and prepared a subsurface log of the test pits. DAY screened soil/fill during excavation with a PID for evidence of VOC impact, and collected select samples for possible laboratory analysis. Pertinent information for each test pit is provided on logs included in Appendix C. Following excavation, the test pits were backfilled with excavated material, and compacted by tamping with the mini-excavator bucket.

### 2.2.3 Rotary-Drilled Test Borings

DAY retained Nature's Way to advance twelve test borings at the Site using a rotary drill-rig. Nature's Way advanced these test borings between February 20, 2018 and March 1, 2018, and the locations of these test borings (designated as TB-25 through TB-27, MW-01 through

MW-08 and MW-06A) are shown on Figure 3, and Figure 3A through Figure 3E. Criteria used in the selection of these rotary-drilled test boring locations included:

- 1) Locations representative of the various Site uses (e.g., former buildings, ROWs, undeveloped, etc.) to document the in-place density of the soil using standardized test methods;
- 2) Evaluation of area-wide trends, identified areas of concern and potential impact by adjoining private properties; and,
- 3) Locations that monitoring wells could provide additional groundwater quality and flow data to fill in data gaps (refer to Section 2.3).

During drilling, continuous split-spoon samples were collected via Standard Penetration Test (SPT) methods in the overburden ahead of the hollow stem augers, except at boring MW-06, which was augered to equipment refusal. Split-spoon soil samples were classified, logged, and also screened with the PID. Selected soil samples were retained for possible testing for the presence of selected chemical constituents. Each boring was advanced to auger refusal, which corresponds to depths ranging between 3.9 feet (MW-04) and 13.0 feet (MW-02) bgs. At test locations MW-02 through MW-08, between 5.0 and 5.6 ft. of bedrock was cored. Pertinent information for each test boring is provided on logs included in Appendix C.

#### 2.2.4 Analysis of Soil/Fill Samples

Various soil or fill samples from test pits, direct-push test borings and rotary-drilled test borings were selected for analytical laboratory testing, refer to Table 2. The analytical laboratory testing program included:

- 1) Samples from test borings and test pits with the greatest field evidence of impact (e.g., highest PID measurements, staining, suspect fill material, odors, etc.);
- 2) Samples collected from immediately above the water table, immediately above bedrock, or near the bottom of the test boring/test pit when evidence of impact was not encountered; and
- 3) Samples based on spatial relationship to overlying fill material and/or other test locations to evaluate vertical and lateral extents of potential impact.

The following samples were delivered under chain-of-custody control to ALS Environmental (ALS) located in Rochester, New York, which is a New York State Department of Health (NYSDOH) Environmental Laboratory Approval Program (ELAP)-certified analytical laboratory. The submitted samples were comprised of fill and native soils as follows:

- Fill material generally consisting of silts and sands with varying amounts of ash, cinders, brick, concrete, etc. was observed in samples TP-01(3.0-4.0), TP-02(4.0), TP-04(6.0-7.0), TP-05(6.0), TP-06(5.5), TP-07(4.0), TP-08(5.5), TP-09(7.0), TP-10(5.0), TP-12(5.0), TP-13(1.0-2.0), TP-14(3.5), TP-14(8.5), TP-17(4.0), TP-19(3.0-4.0), TP-20(9.0), TP-22(4.0-5.0) TB-01(4.0), TB-02(8.0), TB-04(2.5), TB-07(5.5), TB-10(15.0), TB-21(5.0), TB-24(2.5) and MW-08(6.0-8.0).

- Indigenous soils generally consisting of silts and sands with some gravel were observed in samples TP-01(6.0), TP-02(10), TP-06(9.0), TP-13(7.0), TB-13(8.0), TB-14(7.0), TB-15(7.0-7.5), TB-18(10.0-11.0), TB-19(10.0), TB-20(3.0), TB-22(12.0)..

Samples were analyzed for one or more of the following:

- Target Compound List (TCL) and Commissioner Policy 51 (CP-51)-list VOCs using United States Environmental Protection Agency (USEPA) Method 8260;
- TCL SVOCs using USEPA Method 8270;
- Resource Conservation and Recovery Act (RCRA) metals using USEPA Methods 6010 and 7471;
- PCBs using USEPA Method 8082;
- Pesticides using USEPA Method 8081; and/or
- Cyanide using USEPA Method 9012.

The following samples were delivered under chain-of-custody control to Paradigm Environmental Services, Inc. (Paradigm) located in Rochester, New York, which analyzed the samples for asbestos using a polarized light microscopy (PLM) method:

- Samples TP-04(6.0-7.0), TP-05(6.0), TP-06(5.5), TP-08(5.5), TP-17(4.0), TP-19(3.0-4.0), which were fill material and generally consisted of silts and sands with varying amounts of ash, cinders, brick, concrete, etc.

Refer to Table 2 for a summary of the analytical laboratory testing program utilized during the project.

## **2.3 Groundwater Evaluation**

An environmental groundwater evaluation was performed as part of this project. The evaluation included: installation and development of eight monitoring wells; survey of well locations using GPS and laser level equipment in relation to City of Rochester datum; collection of two rounds of static water levels from the eight monitoring wells; collection of the two rounds of groundwater samples from the eight monitoring wells; and analytical laboratory testing of the two round of groundwater samples that were collected from the wells. Additional detail concerning this work is provided in the subsections below.

### 2.3.1 Monitoring Well Installation

Between February 20, 2018 and February 28, 2018, test borings MW-01 through MW-08, were converted to groundwater monitoring wells, refer to Figure 3 and Figure 3A through Figure 3E. Each groundwater monitoring well was constructed with a 2-inch inner diameter Schedule 40 polyvinyl chloride (PVC) screen attached to solid riser piping of the same material. Monitoring well MW-01 was installed as an overburden groundwater monitoring well with a screened interval that extended to approximately 0.5 ft. above bedrock. Monitoring wells MW-02 through MW-08 were overburden/bedrock interface wells with screened intervals that span the overburden groundwater zone and extend approximately 5 feet into the bedrock groundwater zone. Well construction diagrams for each monitoring well that provide additional specifics are included in Appendix C.

### 2.3.2 Well Development

On March 1, 2018, DAY developed the new groundwater monitoring wells by removing groundwater from each well and taking water quality measurements using a Horiba U-22 water quality meter. DAY screened the ambient air inside each of the eight wells with a PID upon being opened, and PID readings in parts per million (ppm) were recorded. The above information is summarized on well development logs that are included in Appendix D.

### 2.3.3 Groundwater Sampling and Analysis

On March 9, 2018, DAY obtained water level measurements and checked for light non-aqueous phase liquid (LNAPL) and dense aqueous phase liquid (DNAPL) using an oil/water interface probe in each of the eight on-site monitoring wells. On April 16, 2018, DAY obtained water level measurements and checked for LNAPL using an oil/water interface probe in each of the eight on-site monitoring wells.

During the March 9, 2018 sampling event, two of the eight wells (i.e., MW-02 and MW-08) were tested for VOCs, SVOCs and metals; thus, were sampled using low-flow sampling techniques to minimize potential sediment/turbidity influence on the analytical laboratory test results. The remaining six wells (i.e., MW-01 and MW-03 through MW-07) were only tested for VOCs; thus, were sampled using conventional purge and sample techniques. Monitoring wells MW-01 through MW-08 were tested a second time for VOCs on April 16, 2018 using conventional purge and sample techniques. Monitoring well sampling logs are included in Appendix D. The groundwater samples from both groundwater sampling events were submitted to ALS for laboratory analysis.

Groundwater samples collected on March 9, 2018 from monitoring wells MW-02 and MW-08 were analyzed for:

- TCL and CP-51 VOCs using USEPA Method 8260,
- TCL and CP-51 SVOCs using USEPA Method 8270, and
- RCRA Metals using USEPA Methods 6010 and 7470.

Groundwater samples collected on March 9, 2018 from monitoring wells MW-01 and MW-03 through MW-07 were analyzed for:

- TCL and CP-51 VOCs using USEPA Method 8260.

Groundwater samples collected on April 16, 2018 from monitoring wells MW-01 through MW-08 were analyzed for:

- TCL and CP-51 VOCs using USEPA Method 8260.

Trip blank samples accompanied the March 9, 2018 and April 16, 2018 groundwater samples to ALS (designated as TBlank-1 and TBlank-2, respectively). Trip blank samples were analyzed by ALS for TCL and CP-51 list VOCs using USEPA Method 8260.

The City of Rochester surveyed the elevation of each monitoring well using a laser level. The surveyed elevations are relative to RTS Monument No. 1230500106 (elevation 541.951 feet) and RTS Monument No. 120410104 (elevation 524.565 feet).: Refer to Table 3 and 4 for the measured elevations of the top center lid and north edge of inner PVC for monitoring wells MW-01 through MW-08.

## **2.4 Geotechnical Assessment**

DAY retained Foundation Design, P.C. to perform a geotechnical assessment concurrently with the environmental evaluation. As part of the geotechnical assessment, representatives of Foundation Design P.C. documented and observed subsurface conditions during the advancement of test borings that were performed on February 12, 2018, test pits that were performed on February 15, 2018 and rotary-drilled wells on February 20, 2018. The information obtained by DAY and Foundation Design P.C. was shared as part of this project. A copy of the geotechnical report prepared by Foundation Design P.C. is included in Appendix E.

## **2.5 Study-Derived Wastes**

Soil and drill cuttings were placed in a roll-off dumpster that was staged on-site. Drilling water, decontamination water and well purge water were placed in two New York State Department of Transportation (NYSDOT)-approved 55-gallon drums, labeled, and staged on-site at a common location. DAY subsequently arranged for the transportation and disposal of the study-derived wastes. A copy of disposal documentation for the study-derived wastes is included in Appendix F.

### 3.0 FINDINGS

The results and findings of this project are presented in this section of the report.

#### 3.1 Subsurface Soil/Fill Environmental Evaluation

Much of the Site is covered by 0.5 foot or less layer of topsoil or asphalt pavement. With the exception of six test locations, heterogeneous fill material is present beneath the topsoil and asphalt pavement. The consistency of this fill varies from parcel to parcel. The majority of fill observed consisted of reworked soil (i.e., various mixtures of silt, sand, gravel and cobbles) with lesser amounts of topsoil, ash, cinders, coal, asphalt, brick, concrete, organics, wood, metal, and/or plastic. However, some locations (e.g., TP-01, TP-07, TP-09, TP-10, TP-11, TP-12, TP-14, TP-15, TP-18 and TP-19) contained approximately 20% to 90% larger debris, such as concrete, brick, concrete block, rock, metal and wood. At many locations, this fill material extended to the top of bedrock. In many instances, fill material within the footprints of former buildings extended to apparent basement floors that were left in-place during their demolition. At other locations, the fill was underlain by indigenous soils. As presented on Figure 4, test locations within the center of the Site and the parcels along Kensington and West Main Street Site boundaries contained the greatest thickness of fill, with the greatest thickness of fill (15.8 ft) being observed in TB-10 located along Kensington Street. The average fill thickness for the Site was calculated to be approximately 5.3 ft. The greatest fill thicknesses appear to be associated with former building footprints (i.e., backfilled basements) and in the center of the Site where a natural low spot (e.g., natural depression, etc.) may have existed. It is plausible that this natural depression was filled in to increase the elevation prior to urban development. This observed fill material is assumed to be historic fill material.

In addition to the fill material described above, fill containing greater than 50% ash and/or cinders were also identified at the Site. Of the 61 test boring and test pit locations included in this study, and the eight test locations previously advanced at 50 York Street and 5 Kensington Street, fourteen of these test locations contained ash/cinder fill that was documented to be 0.5 feet or greater in thickness (refer to Figure 4). As shown, the test locations in which a prevalent quantity of ash/cinder fill was identified are located in the center of the Site and spans the area between York Street and Kensington Street.

Indigenous soils beneath the topsoil, asphalt pavement, or fill material generally consists of sand and silt with lesser amounts of gravel. The overburden soil and fill at the Site are underlain by Dolomite bedrock of the Eramosa (Lockport) Formation. The depth to bedrock at the rotary test borings ranged from approximately 3.9 ft. bgs (MW-04) to 13.0 ft. bgs (MW-02), and the average depth to bedrock in these test borings is approximately 9.1 ft. bgs. Refusal on inferred top of bedrock (i.e., direct-push test boring refusal, rotary test boring refusal, and test pit refusal in which an irregular surface was observed) was encountered at depths ranging between approximately 3.5 ft. bgs (TP-23) and 15.8 ft. bgs (TB-10) with an average depth of 9.0 ft. bgs. In general, the depth to bedrock follows the existing topography of the Site with the shallowest depths to bedrock being along West Main Street and the greatest depths to bedrock being in the middle of the Site and the east side of the Site along Kensington Street (the areas with the greatest thickness of fill). Refer to Figure 2A for a topographic survey of the Site and Figure 5 for a site plan that depicts inferred bedrock contours.

### 3.1.1 Environmental Analytical Laboratory Test Results for Soil/Fill Samples

Test results for VOCs, SVOCs, metals, PCBs, pesticides and toxicity characteristic leaching procedure (TCLP) metals are summarized on Table 5, Table 6, Table 7, Table 8, Table 9, and Table 10, respectively. Copies of the ALS laboratory reports are included in Appendix G. Although the Site is not currently within an environmental program mandated by the New York State Department of Environmental Conservation (NYSDEC), the test results for the soil/fill samples that were tested as part of this study are compared to the following criteria referenced in the NYSDEC document titled “6 *NYCRR Part 375, Environmental Remediation Programs*” dated December 14, 2006.

- UUSCOs;
- RSCO;
- RRSCO;
- CSCOs; and
- PGWSCO.

The test results and comparison to the above criteria are further discussed below. Comparisons to UUSCOs and RSCO assist in evaluating potential re-use of soil and fill both on-site and off-site in accordance with Part-360 regulations and other applicable state and federal regulations.

#### VOCs

As shown on Table 5, VOCs were detected in 15 of the 16 samples that were tested. VOCs detected in one or more sample included: acetone; benzene; 2-butanone; n-butylbenzene; sec-butylbenzene; tert-butylbenzene; carbon disulfide; cyclohexane; ethylbenzene; isopropylbenzene; p-isopropyltoluene; methylene chloride; methylcyclohexane; n-propylbenzene; styrene, 1,1,2,2-tetrachloroethane, tetrachloroethane; toluene; trichloroethene; trichlorofluoromethane; 1,2,4-trimethylbenzene; 1,3,5-trimethylbenzene; m,p-xylene and o-xylene. Concentrations of specific VOCs detected ranged between 0.0003 and 27.00 mg/kg or ppm. Many of the detected concentrations were qualified as estimated (designated by a “J” next to constituent concentration on summary tables) by the analytical laboratory since they were detected below the method detection limit. The VOCs methylene chloride and acetone are common laboratory artifacts; thus, their concentrations detected in the field samples could be attributable to laboratory artifacts.

As shown on Table 5, soil samples from four test locations [TB-07 (5.5), TB-14 (7.0), TP-22 (4.0-5.0) and MW-08 (6.0-8.0)] contained concentrations of VOCs that exceeded one or more SCOs for one or more constituents, (refer to Figure 6 and Figure 7). Three of the samples consisted of fill material, and one of these samples consisted of apparent indigenous soil. The remaining 12 soil samples tested did not contain a constituent concentration exceeding UUSCOs. A summary of the detected VOCs exceeding one or more SCOs is as follows:

- Sample TB-07 (5.5) contained acetone at a concentration exceeding its UUSCO and PGWSCO. [Note: The acetone detected in the sample may be a laboratory artifact.]

- Sample TB-14(7.0) contained 1,2,4-trimethylbenzene and m,p-xylene at concentrations exceeding their UUSCOs and PGWSCO.
- Sample TP-22 (4.0-5.0) contained 1,2,4-trimethylbenzene at a concentration exceeding its UUSCO and PGWSCO.
- Sample MW-08(6.0-8.0) contained benzene, ethylbenzene, toluene, m,p-xylene, and o-xylene at concentrations exceeding their UUSCOs and/or PGWSCO.

The remaining concentrations of VOCs detected in these samples did not exceed their respective UUSCOs, RSCO, RRSCO, CSCO, or PGWSCO.

The measured constituent concentrations of the sixteen soil/fill samples submitted to an analytical laboratory for testing of VOCs were compared to the various criteria previously identified and summarized below:

- Four of the 16 samples contained one or more constituent concentrations exceeding their respective UUSCOs.
- Zero of the 16 samples contained one or more constituent concentrations exceeding their respective RSCO.
- Zero of the 16 samples contained one or more constituent concentrations exceeding their respective RRSCO.
- Zero of the 16 samples contained one or more constituent concentrations exceeding their respective CSCO.
- Four of the 16 samples contained one or more constituent concentrations exceeding their respective PGWSCO.

The samples that exceeded one or more UUSCOs for VOCs are identified on Figure 6. The samples that exceeded one or more PGWSCO, RRSCO and/or CSCO are identified on Figure 7.

### SVOCs

As shown on Table 6, SVOCs were detected in 19 of the 27 soil samples that were tested. SVOCs detected in one or more sample included: acenaphthene; acenaphthylene; anthracene; benzo(a)anthracene; benzo(a)pyrene; benzo(b)fluoranthene; benzo(g,h,i)perylene; benzo(k)fluoranthene; biphenyl; butyl benzyl phthalate; carbazole; chrysene; dibenzo(a,h)anthracene; dibenzofuran; fluoranthene; fluorene; indeno(1,2,3-cd)pyrene; 2-methylnaphthalene; 3&4-methylphenol; naphthalene; phenanthrene; and pyrene. Concentrations of specific SVOCs detected ranged between 0.086 and 20 mg/kg or ppm. Many of the detected concentrations were qualified as estimated by the analytical laboratory since they were detected below the method detection limit.

Fill material samples from ten test locations [TB-14 (7.0), TP-01(3.0-4.0), TP-07(4.0), TP-08(5.5), TP-09(7.0), TP-12(5.0), TP-14(3.5), TP-17(4.0), TP-20(9.0) and TP-22(4.0-5.0)] contained concentrations of SVOCs that exceeded one or more SCOs for one or more constituents, refer to Figure 6 and Figure 7. None of the apparent indigenous soil samples that were tested had SVOC concentrations exceeding UUSCOs. The concentrations of the

SVOCs detected in the other nine samples were below their respective UUSCOs, RSCOs, RRSCOs, CSCOs, and PGWSCOs. A comparison of the detected SVOC concentrations to SCOs is summarized below:

- Sample TB-14 (7.0) contained 2-methylnaphthalene at a concentration exceeding its RSCO. The concentrations of the other SVOCs detected in this sample were below their respective UUSCOs, RSCOs, RRSCOs, CSCOs, and PGWSCOs.
- Sample TP-01(3.0-4.0) contained benzo(b)fluoranthene and indeno(1,2,3-cd)pyrene at concentrations that exceeded one or more of their respective UUSCOs, RSCOs and RRSCOs; however, measured concentrations were below CSCOs. The concentrations of the other SVOCs detected in this sample were below their respective UUSCOs, RSCOs, RRSCOs, CSCOs and PGWSCOs.
- Sample TP-07(4.0) contained benzo(a)anthracene, benzo(a)pyrene; benzo(b)fluoranthene; chrysene; and indeno(1,2,3-cd)pyrene at concentrations that exceeded one or more of their respective UUSCOs, RSCOs, RRSCOs and/or PGWSCOs. Only the benzo(a)pyrene concentration in this sample exceeded its CSCO. The concentrations of the other SVOCs detected in this sample were below their respective UUSCOs, RSCOs, RRSCOs, CSCOs and PGWSCOs.
- Sample TP-08(5.5) contained benzo(a)anthracene, benzo(a)pyrene; benzo(b)fluoranthene; benzo(k)fluoranthene; chrysene; dibenzo(a,h)anthracene; indeno(1,2,3-cd)pyrene and 2-methylnaphthalene at concentrations that exceeded one or more of their respective UUSCOs, RSCOs, RRSCOs and/or PGWSCOs. Only the concentration of benzo(a)pyrene and dibenzo(a,h)anthracene in this sample exceeded their respective CSCOs. The concentrations of the other SVOCs detected in this sample were below their respective UUSCOs, RSCOs, RRSCOs, CSCOs and PGWSCOs.
- Sample TP-09(7.0) contained benzo(b)fluoranthene and indeno(1,2,3-cd)pyrene at concentrations that exceeded their respective UUSCOs, RSCOs, and RRSCOs. None of the detected constituents exceeded their PGWSCOs and CSCOs. The concentrations of the other SVOCs detected in this sample were below their respective UUSCOs, RSCOs, RRSCOs, CSCOs and PGWSCOs.
- Sample TP-12(5.0) contained benzo(a)anthracene, benzo(a)pyrene; benzo(b)fluoranthene; benzo(k)fluoranthene; chrysene; dibenzo(a,h)anthracene; and indeno(1,2,3-cd)pyrene at concentrations that exceeded one or more of their respective UUSCOs, RSCOs, RRSCOs, and/or PGWSCO. Only the concentration of benzo(a)pyrene exceeded its CSCO. The concentrations of the other SVOCs detected in this sample were below their respective UUSCOs, RSCOs, RRSCOs, CSCOs and PGWSCOs.
- Sample TP-14(3.5) contained benzo(a)pyrene; benzo(b)fluoranthene; chrysene; and indeno(1,2,3-cd)pyrene at concentrations that exceeded one or more of their respective UUSCOs, RSCOs, RRSCOs, and/or PGWSCOs. Only the concentration of benzo(a)pyrene in this sample exceeded its CSCO. The concentrations of the other SVOCs detected in this sample were below their respective UUSCOs, RSCOs, RRSCOs, CSCOs and PGWSCOs.
- Sample TP-17(4.0) contained benzo(b)fluoranthene and indeno(1,2,3-cd)pyrene at concentrations that exceeded their respective UUSCOs, RSCOs and RRSCOs. None of the measured constituent concentrations exceeded their respective PGWSCOs and CSCOs.

The concentrations of the other SVOCs detected in this sample were below their respective UUSCOs, RSCOs, RRSCOs, CSCOs and PGWSCOs.

- Sample TP-20(9.0) contained benzo(a)anthracene, benzo(a)pyrene; benzo(b)fluoranthene; benzo(k)fluoranthene; chrysene; dibenzo(a,h)anthracene; and indeno(1,2,3-cd)pyrene at concentrations that exceeded one or more of their respective UUSCOs, RSCOs, RRSCOs and/or PGWSCOs. Only the concentration of benzo(a)pyrene in this sample exceeded its CSCO. The concentrations of the other SVOCs detected in this sample were below their respective UUSCOs, RSCOs, RRSCOs, CSCOs and PGWSCOs.
- Sample TP-22(4.0-5.0) contained benzo(a)anthracene, benzo(a)pyrene; benzo(b)fluoranthene; benzo(k)fluoranthene; chrysene; dibenzo(a,h)anthracene; indeno(1,2,3-cd)pyrene; and 2-methylnaphthalene at concentrations that exceeded one or more of their respective UUSCOs, RSCOs, RRSCOs and/or PGWSCOs. The concentrations of benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(a,h)anthracene; and indeno(1,2,3-cd)pyrene also exceeded their respective CSCOs. The concentrations of the other SVOCs detected in this sample were below their respective UUSCOs, RSCOs, RRSCOs, CSCOs and PGWSCOs.

The measured constituent concentrations of the twenty-seven soil/fill samples submitted to an analytical laboratory for testing of SVOCs were compared to the various criteria previously identified and summarized below:

- Nine of the 27 samples contained one or more constituent concentrations exceeding their respective UUSCOs.
- Ten of the 27 samples contained one or more constituent concentrations exceeding their respective RSCOs.
- Nine of the 27 samples contained one or more constituent concentrations exceeding their respective RRSCOs.
- Six of the 27 samples contained one or more constituent concentrations exceeding their respective CSCOs.
- Six of the 27 samples contained one or more constituent concentrations exceeding their respective PGWSCOs.

The samples that exceeded one or more UUSCOs for SVOCs are identified on Figure 6. The samples that exceeded one or more PGWSCOs, RRSCOs and/or CSCOs are identified on Figure 7.

## Metals

RCRA metals were detected in each of the 27 samples that were tested. A comparison of the detected concentrations of metals in these samples to SCOs is provided on Table 7, and is also summarized below:

- Sample TB-01(3.0) contained lead and mercury at concentrations that exceeded their UUSCOs. The concentrations of the other metals detected in this sample were below their respective UUSCOs, RSCOs, RRSCOs, CSCOs and PGWSCOs.
- Sample TB-02(8.0) contained lead and mercury at concentrations that exceeded their respective UUSCOs. The concentration of mercury also exceeded its respective RSCOs,

RRSCOs, CSCOs and/or PGWSCOs. The concentrations of the other metals detected in this sample were below their respective UUSCOs, RSCOs, RRSCOs, CSCOs and PGWSCOs.

- Sample TB-04(2.5) contained lead at a concentration that exceeded its UUSCO. The concentrations of the other metals detected in this sample were below their respective UUSCOs, RSCOs, RRSCOs, CSCOs and PGWSCOs.
- Sample TP-01(3.0-4.0) contained lead and mercury at concentrations that exceeded their UUSCOs. The concentrations of the other metals detected in this sample were below their respective UUSCOs, RSCOs, RRSCOs, CSCOs and PGWSCOs.
- Sample TP-02(4.0) contained lead and mercury at concentrations that exceeded their respective UUSCOs. The concentration of mercury also exceeded its respective RSCOs, RRSCOs, CSCOs and/or PGWSCOs. The concentrations of the other metals detected in this sample were below their respective UUSCOs, RSCOs, RRSCOs, CSCOs and PGWSCOs.
- Sample TP-06(5.5) contained lead and mercury at concentrations that exceeded their UUSCOs. The concentrations of the other metals detected in this sample were below their respective UUSCOs, RSCOs, RRSCOs, CSCOs and PGWSCOs.
- Sample TP-06(9.0) contained mercury at a concentration that exceeded its UUSCO. The concentrations of the other metals detected in this sample were below their respective UUSCOs, RSCOs, RRSCOs, CSCOs and PGWSCOs.
- Sample TP-08(5.5) contained mercury at a concentration that exceeded its UUSCO. The concentrations of the other metals detected in this sample were below their respective UUSCOs, RSCOs, RRSCOs, CSCOs and PGWSCOs.
- Sample TP-09(7.0) contained lead and mercury at concentrations that exceeded their UUSCOs. The concentrations of the other metals detected in this sample were below their respective UUSCOs, RSCOs, RRSCOs, CSCOs and PGWSCOs.
- Sample TP-10(5.0) contained lead and mercury at concentrations that exceeded their respective UUSCOs. The concentration of mercury also exceeded its respective RSCOs, RRSCOs, and PGWSCOs; however, the measured concentration was below its CSCO. The concentrations of the other metals detected in this sample were below their respective UUSCOs, RSCOs, RRSCOs, CSCOs and PGWSCOs.
- Sample TP-12(5.0) contained lead and mercury at concentrations that exceeded their UUSCOs. The concentrations of the other metals detected in this sample were below their respective UUSCOs, RSCOs, RRSCOs, CSCOs and PGWSCOs.
- Sample TP-13(7.0) contained arsenic, cadmium, chromium and lead at concentrations that exceeded one or more of their respective UUSCOs, RSCOs and RRSCOs. The concentration of arsenic also exceeded its CSCO and PGWSCO. The concentrations of the other metals detected in this sample were below their respective UUSCOs, RSCOs, RRSCOs, CSCOs and PGWSCOs.
- Sample TP-14(3.5) contained lead and mercury at concentrations that exceeded their UUSCOs, RSCOs, RRSCOs and PGWSCO; however, the measured concentrations were below their respective CSCOs. The concentrations of the other metals detected in this sample were below their respective UUSCOs, RSCOs, RRSCOs, CSCOs and PGWSCOs.

- Sample TP-17(4.0) contained lead at a concentration that exceeded its UUSCO. The concentrations of the other metals detected in this sample were below their respective UUSCOs, RSCOs, RRSCOs, CSCOs and PGWSCOs.
- Sample TP-19(3.0-4.0) contained lead at a concentration that exceeded its UUSCO. The concentrations of the other metals detected in this sample were below their respective UUSCOs, RSCOs, RRSCOs, CSCOs and PGWSCOs.
- Sample TP-20(9.0) contained lead and mercury at concentrations that exceeded their UUSCOs, RSCOs, RRSCOs and PGWSCO; however, the measured concentrations were below their respective CSCOs. The concentrations of the other metals detected in this sample were below their respective UUSCOs, RSCOs, RRSCOs, CSCOs and PGWSCOs.
- Sample TP-22(4.0-5.0) contained lead and mercury at concentrations that exceeded their UUSCOs. The concentrations of the other metals detected in this sample were below their respective UUSCOs, RSCOs, RRSCOs, CSCOs and PGWSCOs.
- Sample TP-24(4.0) contained lead at a concentration that exceeded its UUSCO. The concentrations of the other metals detected in this sample were below their respective UUSCOs, RSCOs, RRSCOs, CSCOs and PGWSCOs.

The measured constituent concentrations of the twenty-eight soil/fill samples submitted to an analytical laboratory for testing of metals were compared to the various criteria previously identified and summarized below:

- Eighteen of the 27 samples contained one or more constituent concentrations exceeding their respective UUSCOs.
- Six of the 27 samples contained one or more constituent concentrations exceeding their respective RSCOs.
- Six of the 27 samples contained one or more constituent concentrations exceeding their respective RRSCOs
- Three of the 27 samples contained one or more constituent concentrations exceeding their respective CSCOs.
- Six of the 27 samples contained one or more constituent concentrations exceeding their respective PGWSCOs.

The metal constituents with the greatest level and number of exceedances were lead and mercury. The results for mercury ranged between not detected to 11.8 ppm. The results for lead ranged between 3.5 ppm and 651 ppm.

The samples that exceeded one or more UUSCO for metals are identified on Figure 6. The samples that exceed one or more PGWSCO, RRSCO, or CSCO for metals are identified on Figure 7.

### Cyanide

As shown on Table 7, cyanide was detected in the two samples that were tested were above the detection limit utilized by the analytical laboratory, but were below the UUSCOs, RSCOs, RRSCOs, CSCOs and PGWSCOs.

## PCBs

As shown on Table 8, the concentrations of PCBs in the two samples tested were below the detection limit utilized by the analytical laboratory; thus, were below the UUSCOs, RSCOs, RRSCOs, CSCOs and PGWSCOs.

## Pesticides

As shown on Table 9, pesticides were detected in the two samples that were tested. Samples TP-04(6.0-7.0) and TP-12(5.0) contained 4,4'-DDT(p,p') at concentrations exceeding its UUSCO, but below its RSCO, RRSCO, CSCO and PGWSCO. Sample TP-04(6.0-7.0) also contained Dieldrin and 4,4'-DDE at concentrations exceeding their respective UUSCOs, but below their respective RSCOs, RRSCOs, CSCOs and PGWSCOs.

## Asbestos

Asbestos was not detected in the six fill material samples that were tested.

## Toxicity Characteristic Leaching Procedure (TCLP) Metals

Three soil samples [TP-02(4.0), TP-13(1.0-2.0) and TP-14(3.5)] that generally contained the highest concentrations of one or more metals that exceeded SCOs were submitted for testing of TCLP metals. As shown on Table 10, samples TP-02(4.0), TP-13(1.0-2.0) and TP-14(3.5) did not contain TCLP metals exceeding the TCLP regulatory levels for the toxicity characteristic.

### **3.2 Groundwater Environmental Evaluation**

LNAPL and/or DNAPL were not detected at the eight on-site wells during the March 9, 2018 and April 16, 2018 monitoring events.

Using the surveyed well elevations and static water level measurements from March 9, 2018 and April 16, 2018 the groundwater elevations for on-site wells were calculated for each date, refer to Table 3 and Table 4 respectively. Potentiometric groundwater contour maps for the March 9, 2018 and April 16, 2018 monitoring events were developed and are included as Figure 8 and Figure 9. As shown, groundwater flow on March 9, 2018 and April 16, 2018 was to the northwest, towards Danforth Street and away from West Main Street. The CSOP sub-grade tunnel with groundwater control is located approximately 500 ft from the Site in the downgradient direction (i.e., the tunnel is located northwest of the Site). It is possible that the presence of this tunnel is influencing the groundwater conditions at the Site.

#### 3.2.1 Environmental Analytical Laboratory Test Results for Groundwater Samples

The groundwater samples collected from wells MW-01 through MW-08 on March 9, 2018 and April 16, 2018 were analyzed by ALS for: TCL and CP-51 VOCs using USEPA Method 8260. In addition, the March 9, 2018 groundwater samples from monitoring wells MW-02 and MW-08 were also tested for: TCL SVOCs using USEPA Method 8270 and RCRA metals

using USEPA Methods 6010 and 7470 (refer to Table 2). Copies of the ALS laboratory reports are included in Appendix G.

The VOCs, SVOCs, and RCRA metals test results for the March 9, 2018 and April 16, 2018 groundwater samples are included in Table 11. A comparison of the March 9, 2018 and April 16, 2018 test results to groundwater standards or guidance values referenced in the NYSDEC document titled “Division of Water Technical and Operational Guidance Series 1.1.1; Ambient Water Quality Standards and Guidance Values and Groundwater Effluent Limitations” dated June 1998 as amended with April 2000 and June 2004 addendum tables (TOGS) are included on Table 11. The results and comparison to the TOGS 1.1.1 groundwater standards are summarized below:

- VOCs were not detected at concentrations above analytical laboratory detection limits in the March 9, 2018 groundwater samples collected from MW-01 through MW-08. VOCs were detected in groundwater samples collected on April 16, 2018 from monitoring wells MW-01, MW-02, MW-04, MW-05, MW-07 and MW-08; however, none of the detected concentrations exceed NYSDEC TOGS 1.1.1 standards and guidance values. Specific VOCs detected in one or more of these April 16, 2018 groundwater samples included: acetone; tert-butylbenzene, carbon disulfide, chloroform; 1,1-dichloroethane, cyclohexane, and methylcyclohexane.
- Only the SVOC naphthalene was detected in the March 9, 2018 groundwater sample collected from MW-02. The concentration of the naphthalene in this sample did not exceed its respective NYSDEC TOGS 1.1.1 guidance value. No other SVOCs were detected in the sample collected from MW-02 on March 9, 2018. SVOCs were not detected in the March 9, 2018 groundwater sample collected from monitoring well MW-08 at concentrations above reported analytical laboratory detection limits. SVOCs were not tested during the April 16, 2018 groundwater sampling event.
- The metal barium was detected in the groundwater samples collected on March 9, 2018 from MW-02 and MW-08. The concentrations of barium detected in MW-02 (i.e., 138 ug/l) and MW-08 (i.e., 78 ug/l) were below the TOGS 1.1.1 standard of 1,000 ug/l. No other RCRA metals were detected in these two groundwater samples. Metals were not tested during the April 16, 2018 groundwater sampling event.

VOCs were not detected in the March 9, 2018 Quality Assurance/Quality Control (QAQC) Trip Blank (Sample TBlank-1) at concentrations above reported analytical laboratory detection limits. Acetone was detected in the April 16, 2018 QA/QC Trip Blank (Sample TBlank-2) at a concentration exceeding the detection limit utilized by the analytical laboratory. The QA/QC Trip Blank laboratory results can be found in Appendix G.

### **3.3 Geotechnical Assessment**

A copy of the geotechnical report prepared by Foundation Design P.C. is included in Appendix E. The report includes an assessment of subsurface conditions, and conclusions and recommendations based on evaluation of site conditions in relation to geotechnical concerns associated with redevelopment of the Site.

In summary, the geotechnical assessment report indicates that the typical subsurface profile consists of heterogeneous fill material over marsh deposits or glacial till, then bedrock. The geotechnical quality of the fill material across the Site varied from relatively clean earth fill to fill of marginal and poor quality (i.e., containing 40 to 60% building debris, such as concrete, brick and metal).

The geotechnical report concluded that the in-place fill is not suitable as is to support foundations or floors of new structures, and that building on the in-place fill could result in varying amounts of settlement over time. In addition, the shallow bedrock on portions of the Site needs to be considered in relation to design and construction of new buildings.

Figure 10 depicts fill material use restrictions during redevelopment based on geotechnical conditions observed at test locations completed as part of this study and at the two TIO parcels. The geotechnical conditions on the parcels studied were characterized into one or more the three categories:

- Fill Material Not Acceptable for Use at Buildings or Parking Lots (highlighted red).
- Fill Material Not Acceptable for Use at Buildings, but Acceptable for Re-Use at Parking Lots after Reworking and/or Sorting (highlighted orange).
- Fill Material Not Acceptable for Use at Buildings "As Is", but Acceptable for Re-Use at Buildings and Parking Lots after Reworked and/or Sorting (highlighted green).
- Fill Material that has not been investigated and therefore not characterized (unshaded).

In general, and as shown on Figure 10, the following trends were observed based on the limited data collected during the Phase II Investigations completed at the Site and the TIO parcels:

- Fill material not acceptable for building or parking lot use is located in the center and east side of the Site. If disturbed or removed this material is likely to be considered a historic fill material subject to industrial solid waste regulations and disposal requirements.
- Fill material not acceptable for use at buildings, but acceptable for re-use at parking lots after reworking and/or sorting is located on the south and east portions of the site as well as select locations in which a fill transitions from the unacceptable category to acceptable after reworking and/or sorting category.
- Fill material not acceptable for use at buildings "as is", but acceptable for re-use at buildings and parking lots after reworking and/or sorting is located on the southern portions of the Site along West Main Street and the northern portions of the Site along York Street.

Actual subsurface conditions and fill boundaries encountered during redevelopment may differ from those presented herein. Figure 10 and the fill characterization site model for should be updated as additional information becomes available. Also, a qualified geotechnical representative should be present during site redevelopment activities that disturb the subsurface to confirm the conclusions regarding fill re-use specifications presented herein.

The geotechnical conclusions and recommendations are provided in Section 4.2.

## 4.0 CONCLUSIONS AND RECOMMENDATIONS

This section of the report summarizes the findings of the pre-development Phase II ESA and geotechnical studies that were performed at the Site, and also provides conclusions and recommendations as they pertain to environmental and geotechnical conditions that should be considered when planning and implementing the redevelopment of the Site. This investigation only included environmental and geotechnical assessment of 12 City-owned parcels, and the previous Confirmatory Phase II ESAs that were conducted for the City on the 50 York Street and 5 Kensington Street TIO parcels. The conclusions and recommendations provided herein assume future redevelopment to consist primarily of commercial re-use, but may also include some mixed residential and commercial uses.

Based on the environmental and geotechnical Site conditions identified during this study, and on current City plans for redevelopment of the Site, restricted residential use and/or restricted commercial use as defined in NYSDEC Part 375-1.8 are viable options if corrective actions such as those identified herein are implemented.

Restricted residential use allows common ownership or a single owner/managing entity of the site, and active recreational uses that are public uses with a reasonable potential for soil contact. Restricted residential use restricts or prohibits:

- Single family housing; and
- Vegetable gardens, although community vegetable gardens could possibly be considered with regulatory agency approval.

Commercial components would likely not require common ownership, and also allow passive recreational uses, which are public uses with limited potential for soil contact.

### 4.1 Environmental Considerations

Heterogeneous fill material is present across most of the Site. A majority of the fill material consists of re-worked soil (i.e., various mixtures of silt, sand, gravel and cobbles) with lesser amounts of topsoil, ash, cinders, coal, asphalt, brick, concrete, organics, wood, metal and/or plastic. Some locations contained approximately 20% to 90% larger debris such as concrete, brick, concrete block, rock, metal and wood. The consistency of the fill material changes from parcel to parcel, and some of it may be associated with backfilling basements/grading over time as former buildings were demolished. In addition, an apparent older fill material containing greater than 50% ash and/or cinders (>0.5 feet thick) was also observed in the center of the Site spanning the area between York Street and Kensington Street. It is suspected that this older ash/cinder laden fill may have been deposited prior to any development on this portion of the Site.

Indigenous soils (mostly first encountered beneath the fill material) generally consists of sand and silt with lesser amounts of gravel. The overburden soil and fill at the Site are underlain by Dolomite bedrock of the Eramosa (Lockport) Formation. The depth to bedrock at the rotary test borings ranged from approximately 3.9 ft. to 13.0 ft. bgs, and the average depth to bedrock is approximately 9.1 ft. bgs. Refusal on inferred top of bedrock (i.e., direct push test boring refusal, rotary test boring refusal and test pit refusal in which an irregular surface was

observed) was encountered at depths ranging between approximately 3.5 ft. bgs and 15.8 ft. bgs with an average depth of 9.0 ft. bgs. A summary of the analytical laboratory results obtained during this study is provided below:

- Four of the sixteen soil/fill samples tested contained concentrations of one or more VOCs exceeding their respective UUSCOs and/or PGWSCOs, but did not exceed their RSCOs, RRSCOs or CSCOs.
- Eighteen samples of soil/fill analyzed during this study were found to contain concentrations of the metals mercury, lead, arsenic and/or cadmium that exceeded their respective UUSCOs, RSCOs, RRSCOs and/or PGWSCOs. In addition, fill samples TB-02(8.0) and TP-02(4.0) contained mercury and TP-13(1.0-2.0) contained arsenic, at concentrations that exceeded their respective CSCOs.
- Ten of the twenty-eight samples tested contained one or more SVOCs at concentrations exceeding their respective UUSCOs, RSCOs, RRSCOs and/or PGWSCOs.
- Six of the twenty-eight soil/fill samples tested during this study were found to contain concentrations of one or more SVOC that exceeded their respective CSCOs.
- Neither of the two samples tested for cyanide contained concentrations exceeding its UUSCO, RSCO, RRSCO, CSCO or its PGWSCO.
- The two samples tested for PCBs did not contain a constituent concentration exceeding the detection limit utilized by the analytical laboratory.
- Both of the samples tested for pesticides contained one or more constituents exceeding their respective UUSCOs; however, the measured concentrations did not exceed their respective RSCOs, RRSCOs, CSCOs or PGWSCOs.
- The three samples tested for TCLP metals did not exceed the concentration thresholds for toxicity characteristic.
- The six samples tested for asbestos were found to contain no asbestos (i.e., listed as 0%).

A summary of test results in relation to samples media is presented below:

- Fill containing more than de minimis amounts of ash and/or cinders were identified at the Site. This material likely would not be allowed to be beneficially used on-site or off-site, and may require additional characterization testing and disposal at a regulated NYSDEC Part 360 landfill facility. Of the 61 test boring and test pit locations, eleven samples contained a prevalent quantity of ash/cinder fill (defined as 0.5 feet of ash/cinder fill thickness or greater). Ash/cinder fill from eight of these eleven locations were tested for one or more analytical laboratory parameters, and seven of the samples contained one or more constituents that exceeded one or more SCOs, five of which also exceeded CSCOs. In general, the eleven locations in which a prevalent quantity of ash/cinder fill was identified are located in the center of the Site and on the northeast side of the Site. [Note, three test locations on the 5 Kensington Street parcel that adjoins some parcels covered by this study also contained fill material with more than de minimis amounts of ash and/or cinders.] If disturbed or removed, it should be assumed that this ash/cinder fill material would be characterized as a historic fill material and be considered an industrial solid waste.

- Fill samples containing de minimis amounts of ash and/or cinders were also identified at the Site in twenty test locations. This material may be suitable for on-site use or off-site as a beneficial use determination (BUD) material following additional evaluation in accordance with applicable regulations. Seventeen of the twenty fill samples that were tested that contained de minimis quantities of ash and/or cinders contained one or more analytical laboratory parameters that exceeded one or more SCOs. In addition, four of the twenty fill samples that were tested that contained de minimis quantities of ash and/or cinders also exceeded one or more CSCOs.
- Of the fourteen indigenous soil samples that were tested for one or more analytical laboratory parameters, two samples contained one or more constituents at concentrations that exceed their respective UUSCOs and/or PGWSCOs, but did not exceed their respective RSCOs, RRSCOs, or CSCOs.

Based on the subsurface evaluation performed to date, areas of fill material at the Site will require specialized handling/disposal as a construction and demolition (C&D) waste or solid waste if displaced during redevelopment or other future activities. The remaining reworked soil fill likely could be re-used on-site and could be exempt from being considered a regulated solid waste requiring off-site disposal if pre-determined and/or case-specific beneficial use determinations (BUDs) referenced in NYSDEC Part 360 (Solid Waste Management Facilities) §360-1.15 (Beneficial Use) are obtained.

Petroleum impacted soil is present on the northern portion of the 906-910 West Main Street parcel and a portion of the Ruby Place Public ROW. Field evidence (e.g., odors and elevated PID readings) of petroleum impacted groundwater was observed at MW-08 located in the Ruby Place Public ROW. In addition, access to parcels [i.e., 24 York Street (former gas station), 932-938 West Main Street, (auto collision shop) or 924-930 West Main Street (heating oil furnace facility with suspect petroleum-based product disposal history) in which petroleum use and storage was known or suspected to occur was not provided. As such, these parcels are data gaps that could influence the conclusions and recommendations stated herein.

No VOCs were detected in the March 9, 2018 groundwater samples from monitoring wells MW-01 through MW-08 at concentrations exceeding the laboratory detection limits. Several VOCs were detected in the April 16, 2018 groundwater samples collected from multiple groundwater monitoring wells; however, the detected concentrations were below TOGS 1.1.1 standards and guidance values. While the SVOC naphthalene was detected in the sample collected on March 9, 2018 from monitoring well MW-02, the measured concentration did not exceed its TOGS 1.1.1 groundwater standard. The metal barium was detected in the March 9, 2018 groundwater samples collected from monitoring wells MW-02 and MW-08; however, the concentrations did not exceed its TOGS 1.1.1 standard.

Based on the studies completed to date, soil vapor intrusion into new buildings or structures does not appear to be a concern across the majority of the Site. However, the areas in proximity to test boring TB-14 and monitoring well MW-08 where petroleum impacted soils were observed present a potential for soil vapor intrusion into new buildings or structures.

## Environmental Recommendations

Based on the studies performed and on the City's redevelopment plans, it is recommended that the following environmental activities be implemented:

1. Obtain access to the remaining parcels comprising the Bulls Head Sub Area North project area where subsurface conditions have not yet been investigated, and complete environmental and geotechnical investigative studies to characterize the subsurface conditions prior to redevelopment. Several of these outstanding parcels (i.e., 24 York Street, 932-938 West Main Street and 924-930 West Main) have a history of use/storage of petroleum products. The investigative studies could be completed prior to or during the City's acquisition of new parcels within the Bulls Head Sub Area North project area.
2. Further characterize, and possibly remediate, petroleum impacted soil in the area of TB-14 and possibly MW-08.
3. Further characterize environmental conditions at the 50 York Street and 5 Kensington Street TIO parcels.
4. Prepare and implement an Environmental Management Plan (EMP) to provide guidance on the identification, characterization, handling, staging, re-use and/or disposal of fill materials, soil, etc. that are disturbed or displaced as a result of the City's redevelopment activities. The EMP should also establish goals, procedures, appropriate response actions and contingency actions to be used by on-site personnel should fill material, contaminated groundwater, or other unknown contaminated media be encountered and disturbed in the future. The EMP should be tailored to provide specific and applicable guidance and provisions in relation to the City's Redevelopment plan for the Site, including the City's cut and fill grading plan. In addition, it is recommended that a site-specific Health and Safety Plan (HASP) be developed and included with the EMP to protect construction workers, on-site occupants, and the nearby community from exposures to environmental constituents in the fill material should it be disturbed (i.e. during redevelopment activities, construction activities, utility trenching, site grading, etc.). It is also recommended that an environmental project monitor (EPM) be on-site on a full-time basis to assist with implementation of the EMP during construction activities that have the potential to disturb subsurface impacted media. Examples include earthwork (trenching, grading, etc.) during redevelopment of the Site. The EPM can visually observe and field screen Site materials as they are disturbed/excavated, provide guidance on segregation, management and characterization of potentially impacted materials, provide guidance if unanticipated subsurface environmental conditions are encountered, and help with implementation of other EMP requirements.
5. Possibly obtain one or more beneficial use determination (BUD) to address: 1) on-site re-use of on-site soil/fill; and 2) import of certain geotechnical fill materials (e.g., soil, recycled concrete, etc.).
6. Prepare a master grading plan partly based on future development plans so that disturbance/displacement of impacted soil/fill material can be quantified in order to plan for environmental requirements and associated costs.
7. Although the potential for soil vapor intrusion into new buildings appears low, installing the below slab infrastructure of a sub-slab depressurization system (SSDS) for new structures should be considered as part of new development.

## 4.2 Geotechnical Considerations

The typical subsurface profile consists of heterogeneous fill material over marsh deposits or glacial till, then bedrock. The in-place fill is not suitable as is to support foundations or floors of new structures. In addition, the shallow bedrock on portions of the Site needs to be considered in relation to design and construction of new buildings.

As shown on Figure 10, the following trends were observed based on the limited data collected during the Phase II Investigations completed at the Site and the TIO parcels:

- Fill material not acceptable for building or parking lot use is located in the center and east side of the Site. If disturbed or removed this material is likely to be considered a historic fill material subject to industrial solid waste regulations and disposal requirements.
- Fill material not acceptable for use at buildings, but acceptable for re-use at parking lots after reworking and/or sorting is located on the south and east portions of the site as well as select locations in which a fill transitions from the unacceptable category to acceptable after reworking and/or sorting category.
- Fill material not acceptable for use at buildings “as is”, but acceptable for re-use at buildings and parking lots after reworking and/or sorting is located on the southern portions of the Site along West Main Street and the northern portions of the Site along York Street.

The following geotechnical conclusions and recommendations are provided for consideration:

1. “We conclude that the in-place fill is not suitable to support the foundations or floors for the new structure(s). The variable fill quality will result in erratic amounts of settlement as the fill continues to consolidate under its own weight. Organic matter within the fill will decompose with time, resulting in more settlement.

If constructed over this fill material, it is our opinion that floors and foundations would settle. This would result in unacceptable amounts of distress in masonry walls and building framing. Similar problems would be experienced by floors constructed over the fill. Floors would settle erratically, resulting in wavy, uneven, settled, and severely cracked surfaces.”

2. “Depending on site grades and finished floor grades, appropriate foundation approaches will vary. For conceptual planning, we suggest locating the commercial buildings along West Main Street and designing the Police Station as a free-standing structure, located as far north on the parcel as possible. Under this approach, we believe that removal of the in- place fill material and replacement with imported structure fill would be required for the building areas.

Any structure located in the center of the parcel (i.e., into the filled portion of 42 York Street) will require a deep foundation solution due to the highly compressible ash fill present. If an interconnected structure is used, foundations for the commercial building may require dropping the foundations to bear on bedrock to control differential settlement between spread footing supported commercial building and pile-supported Police Station.

It is recommended that the bedrock surface elevations/refusal depths at the test hole locations be reviewed when establishing level floor grade for the commercial building along West Main Street. Bedrock conflicts are possible. If bedrock is encountered, hoe-ramming or blasting would be required to remove the bedrock.”

3. “Where the fill is completely removed and replaced from building areas, standard slab-on-grade construction can be utilized. In areas where deep foundations are used to span over the in-place fill, structural floor slabs will be required, supported by deep foundations and grade beams. Where a structural slab is used, plan to hang the sub-floor utilities from the bottom of the structural slab.”
4. “NYS Building Code identifies various seismic design criteria for this project. We recommend using a Site Classification of D (Stiff Soil Profile). Based on the ASCE 7-10 guidelines, we recommend using the following seismic design parameters for this Risk Category IV structure.

Table No. 1 – Seismic Design Parameters – ASCE 7-10					
Spectral Response Acceleration		Soil Factors		Design Spectral Response Acceleration	
S <sub>s</sub>	S <sub>1</sub>	S <sub>ms</sub>	S <sub>m1</sub>	SD <sub>s</sub>	SD <sub>1</sub>
0.165g	0.060g	0.263g	0.143g	0.176g	0.095g

If you progress your design using ASCE 7-16 guidelines, we recommend using the following seismic design parameters for this Risk Category IV structure.”

Table No. 2 – Seismic Design Parameters – ASCE 7-16					
Spectral Response Acceleration		Soil Factors		Design Spectral Response Acceleration	
S <sub>s</sub>	S <sub>1</sub>	S <sub>ms</sub>	S <sub>m1</sub>	SD <sub>s</sub>	SD <sub>1</sub>
0.165g	0.048g	0.259g	0.116g	0.172g	0.077g

5. “Due to the depth of the in-place fill deposits, removal and replacement of the fill from under pavements is not practical. Since the new pavements will be supported by the in-place fill material, we suggest salvaging material removed from the building areas to raise grades for parking lots. This may require sorting out areas with high brick, ash, concrete, and wood concentrations.

Recognize that where new pavements are constructed over the in-place fill material, wavy, uneven, settled, and severely cracked surfaces are likely to develop long term. We recommend accepting the risk with long-term performance and incorporating measures into the pavement design to mitigate this risk. For conceptual planning, we recommend budgeting based on the Standard and Heavy-Duty pavement sections tabulated below.

Table No. 3 - Standard Section		
1.5"	Asphalt Topcoat	NYSDOT Item 403.178902
2.5"	Asphalt Binder	NYSDOT Item 403.138902
12.0"	Crusher-run Stone Subbase	NYSDOT Item 304.12
	Bi-axial Geogrid	Tensar BX-1200
	Subgrade	Approved Proof Roll

Table No. 4 — Heavy Duty Section		
1.5"	Asphalt Topcoat	NYSDOT Item 403.198902
2.5"	Asphalt Binder	NYSDOT Item 403.138902
15.0"	Crusher-run Stone Subbase	NYSDOT Item 304.12
	Bi-axial Geogrid	Tensar BX-1200
	Subgrade	Approved Proof Roll

We recommend sloping both the pavement surface and subgrade at slopes of at least 2.0 percent to facilitate water flow toward the stormwater system and prolong the pavement life. Drainage of the subbase is critical to proper performance of the pavements. Install 25-foot-long weeps off the storm inlets at low points to allow water out of the stone subbase and into the storm water system.”

6. It is recommended that a geotechnical project monitor (GPM) be on-site on a full-time basis during construction activities that have the potential to disturb subsurface media that is unsuitable for building or has building restrictions. Examples include earthwork (trenching, grading, etc.) during redevelopment of the Site. The GPM can visually observe Site materials as they disturbed/excavated in relation to geotechnical considerations, provide guidance on material segregation, sorting and compaction when materials are to be re-used, and provide guidance if unanticipated subsurface conditions are encountered that have the potential to impact geotechnical conditions.
  
7. This investigation only included environmental and geotechnical assessment of 12 City-owned parcels, and the 50 York Street and 5 Kensington Street parcels where previous Confirmatory Phase II ESAs were conducted for the City. It is recommended that geotechnical investigation work be conducted on the remaining parcels located within the Bulls Head Sub Area North project area prior to its redevelopment.

VOC = Volatile Organic Compound  
SVOC = Semi-Volatile Organic Compound  
Sample PID reading was the greater value between headspace and ambient air screening results  
MS/MD = Matrix Spike/Matrix Spike duplicate  
PID Reading = Photoionization Detector Reading in parts per million (ppm)  
TCLP = Toxicity Characteristic Leaching Procedure

PCB= Polychlorinated Biphenyl  
CN = Cyanide  
Pest. = Pesticides  
Rea. = Reactivity  
Asbes = Asbestos

**Re: GPR Investigation for Underground Utilities and UST's**

We appreciate the opportunity to provide this report for our work completed on 9/20/17.

#### **PURPOSE**

The purpose of this project was to search for underground anomalies, including utilities, UST related items, and foundations, within an approximate 130'x80' area at the address listed above. This area has been clearly distinguished in the following site sketch of the findings.

#### **EQUIPMENT**

- **Ground Penetrating Radar (GPR), Manufacturer: GSSI, Model: SIR-3000 processing unit with 400 MHz antenna.** GPR works by sending pulses of energy into a material and recording the strength and the time required for the return of the reflected signal. Reflections are produced when the energy pulses enter into a material with different electrical properties from the material it left. The strength of the reflection is determined by the contrast in signal speed between the two materials. The total depth achieved can be as much as 8' or more with this antenna but can vary widely depending on the conductivity of the materials. For more information, please visit: <http://www.geophysical.com/Documentation/Brochures/GSSI-UtilityScanBrochure.pdf>
- **RD7000 pipe locator, Manufacturer: Radiodetection.** The RD7000 can detect the electromagnetic fields from live power or radio frequency signals. It can also be used in conjunction with a transmitter to connect directly to accessible, metallic pipes, risers, or tracer wires. A tone is sent through the pipe or tracer wire at a specific frequency which can then be detected by the receiver. For more information, please visit: <http://www.spx.com/en/radiodetection/pd-rd7000/>

#### **PROCESS**

Our process began with using the RD7000 to locate pipes or utilities throughout the scan area. We first swept all areas with the receiver to detect live power or radio frequency signals followed by connecting to any visible risers or tracer wires that were in the area provided that there was an exposed metallic surface. Locations and depths were painted or flagged on the surface. Depths cannot always be provided depending on the location method and can be prone to error.

Initial GPR scans were then collected in order to evaluate the data and calibrate the equipment. Based on these findings, a survey strategy is formed, typically consisting of scanning the entire area in a grid with 3'-5' scan spacing in order to locate any potential utilities, UST's, etc. that were not found with RD. The GPR data is interpreted in real time and anomalies in the data are located and marked on the surface along with their depths using spray paint, pin flags, etc. Depths are dependent on the dielectric of the materials being scanned so depth accuracy can vary throughout a site.

## **LIMITATIONS**

Please keep in mind that there are limitations to any subsurface investigation. The equipment may not achieve maximum effectiveness due to soil conditions, above ground obstructions, reinforced concrete, and a variety of other factors. No subsurface investigation or equipment can provide a complete image of what lies below. Our results should always be used in conjunction with as many methods as possible including consulting existing plans and drawings, exploratory excavation or potholing, visual inspection of above ground features, and utilization of services such as Dig Alert/Underground Service Alert.

At this site, our penetration depths were limited to 3.5'-4' throughout the area. Also, as on all projects, we could not see anomalies closer than, and running parallel to any above ground obstructions (foundation edges sticking up above the rest of the ground surface).

## **FINDINGS:**

After scanning all areas we were able to detect the presence of possible former building foundations. The detection of these foundations appeared to be clustered on the western edge of the premises in the area scanned. The depth of the foundations appeared to differ; in most locations they were only a few inches beneath the surface, while in other locations we believe they may have been as deep as 3' beneath the surface. These areas have been labeled in the site sketch at the end of this report.

As for utilities and UST's, we did not detect any anomalies that would suggest their presence was on site. We did see two pipe stub ups on the premises, but could not find any anomalies showing their paths.

The following page will further explain the findings.

---

## **CLOSING**

Ground Penetrating Radar Systems, Inc. has been in business for over 15 years, specializing in underground storage tank location, concrete scanning, utility locating, as well as shallow void detection throughout the US and Canada. I encourage you to visit our website ([www.gp-radar.com](http://www.gp-radar.com)) and contact any of the numerous references listed.

GPRS appreciates the opportunity to offer our services, and we look forward to continuing to work with you on future projects. Please feel free to contact us for additional information or with any questions you may have regarding this GPR Investigation.

Signed,

Jim Bell  
Project Manager- Upstate New York

**Re: GPR Investigation for Underground Utilities and UST's**

We appreciate the opportunity to provide this report for our work completed on 9/20/17.

#### **PURPOSE**

The purpose of this project was to search for underground anomalies, including utilities, UST related items, and foundations, within an approximate 70'x20' area at the address listed above. This area has been clearly distinguished in the following site sketch of the findings.

#### **EQUIPMENT**

- **Ground Penetrating Radar (GPR), Manufacturer: GSSI, Model: SIR-3000 processing unit with 400 MHz antenna.** GPR works by sending pulses of energy into a material and recording the strength and the time required for the return of the reflected signal. Reflections are produced when the energy pulses enter into a material with different electrical properties from the material it left. The strength of the reflection is determined by the contrast in signal speed between the two materials. The total depth achieved can be as much as 8' or more with this antenna but can vary widely depending on the conductivity of the materials. For more information, please visit: <http://www.geophysical.com/Documentation/Brochures/GSSI-UtilityScanBrochure.pdf>
- **RD7000 pipe locator, Manufacturer: Radiodetection.** The RD7000 can detect the electromagnetic fields from live power or radio frequency signals. It can also be used in conjunction with a transmitter to connect directly to accessible, metallic pipes, risers, or tracer wires. A tone is sent through the pipe or tracer wire at a specific frequency which can then be detected by the receiver. For more information, please visit: <http://www.spx.com/en/radiodetection/pd-rd7000/>

#### **PROCESS**

Our process began with using the RD7000 to locate pipes or utilities throughout the scan area. We first swept all areas with the receiver to detect live power or radio frequency signals followed by connecting to any visible risers or tracer wires that were in the area provided that there was an exposed metallic surface. Locations and depths were painted or flagged on the surface. Depths cannot always be provided depending on the location method and can be prone to error.

Initial GPR scans were then collected in order to evaluate the data and calibrate the equipment. Based on these findings, a survey strategy is formed, typically consisting of scanning the entire area in a grid with 3'-5' scan spacing in order to locate any potential utilities, UST's, etc. that were not found with RD. The GPR data is interpreted in real time and anomalies in the data are located and marked on the surface along with their depths using spray paint, pin flags, etc. Depths are dependent on the dielectric of the materials being scanned so depth accuracy can vary throughout a site.

## **LIMITATIONS**

Please keep in mind that there are limitations to any subsurface investigation. The equipment may not achieve maximum effectiveness due to soil conditions, above ground obstructions, reinforced concrete, and a variety of other factors. No subsurface investigation or equipment can provide a complete image of what lies below. Our results should always be used in conjunction with as many methods as possible including consulting existing plans and drawings, exploratory excavation or potholing, visual inspection of above ground features, and utilization of services such as Dig Alert/Underground Service Alert.

At this site, our penetration depths were limited to 3.5'-4' throughout the area. Also, as on all projects, we could not see anomalies closer than, and running parallel to any above ground obstructions (foundation edges sticking up above the rest of the ground surface).

## **FINDINGS:**

After scanning all areas we were able to detect the presence of one pipe, and another unknown anomaly in the area. The pipe we located was approximately 2' deep, and will be depicted on the site map at the end of this report. We located the path of this pipe, initially, by clamping directly onto the pipe and inducing a tone onto the line. We then used the RD7000 wand to trace the signal out. We also saw the anomaly associated with this pipe with the radar, which allowed us to determine the approximate depth of the pipe.

The unknown anomaly was approximately 3' deep, and was located very near the turn in the pipe located previously. The dimensions of the anomaly were approximately 2'x 2' in size. It is not believed to be a UST, but more likely just some sort of debris from a previous period. This anomaly has also been marked out on the attached site sketch.

The following page will further explain the findings.

---

## **CLOSING**

Ground Penetrating Radar Systems, Inc. has been in business for over 15 years, specializing in underground storage tank location, concrete scanning, utility locating, as well as shallow void detection throughout the US and Canada. I encourage you to visit our website ([www.gp-radar.com](http://www.gp-radar.com)) and contact any of the numerous references listed.

GPRS appreciates the opportunity to offer our services, and we look forward to continuing to work with you on future projects. Please feel free to contact us for additional information or with any questions you may have regarding this GPR Investigation.

Signed,

Jim Bell  
Project Manager- Upstate New York

Direct: 315-715-5137

Lead Technician BELL, JAMES

Phone 315-715-5137

Email jim.bell@gp-radar.com

Thank you for using Ground Penetrating Radar Systems on your project. We appreciate the opportunity to work with you. If you have questions regarding the results of this scanning, please contact the lead GPRS technician on this project.

**Equipment Used:**

The following equipment was used on this project:

- 400 MHz GPR antenna. Typically capable of detecting objects several feet deep. Maximum effective depth depends on site and soil conditions.
- At this site, the maximum effective depth of the GPR was 6.5'.
- RD 7000/8000 Radio Frequency detector. Detects electromagnetic fields. Used to actively trace metallic pipes and tracer wires, or passively detect electric, communications and other lines.
- Average penetration depth throughout all areas appeared to be approximately 4'-4.5'. Cannot see anomalies within 3' of obstructions (fences, walls, etc.)

**Work Performed**

Ground Penetrating Radar Systems performed the following work on this project:

Scanning the specified area to locate underground utilities and other significant anomalies. A tracer signal was sent along any accessible metallic utility or tracer wire, and the area was scanned with GPR to locate any additional targets. The locations of any detected utilities and anomalies were marked directly at the site with paint, flags, stakes, or other appropriate means, and results were reviewed with onsite personnel.

- Only line found is believed to be a water line at approximate 4'-4.5'. Marked on the surface with pink paint. Line found running southeast towards fire hydrant on 816 Brown Street property.

Scanning the designated area to attempt to locate evidence of underground storage tanks and/or UST removal excavations. The locations of any USTs, associated piping, or excavations detected were marked with paint, flags, or other appropriate means, and results were reviewed with onsite personnel.

- Searching portions of 3 properties for signs of present tanks, former tank graves, fill material, and tank related pipes.
- No underground storage tanks were detected at this site. The areas were scanned thoroughly, and no anomalies consistent with the presence of an underground storage tank could be found.
- None detected.

- No evidence of tanks, or tank related anomalies detected throughout the areas. No fill material was detected, but this may be due to the majority of the sites being made up of fill material, therefore not being different from native soil.

16									

- Notes:** 1) Water levels were made at the times and under conditions stated. Fluctuations of groundwater levels may occur due to seasonal factors and other conditions.  
 2) Stratification lines represent approximate boundaries. Transitions may be gradual.  
 3) PID readings are referenced to an isobutylene standard. A MiniRae 3000 equipped with a 10.6 eV lamp was used to obtain the PID readings.  
 4) NA = Not Available or Not Applicable  
 5) Headspace PID readings may be influenced by moisture

**APPENDIX E**

**Pre-Development Assessment Geotechnical Report**

# Foundation Design, P.C.

SOIL • BEDROCK • GROUNDWATER

June 20, 2019

Day Environmental, Inc.  
1563 Lyell Avenue  
Rochester, New York 14606

Attention: Mr. Jeffrey A. Danzinger

Reference: Bullshead High Priority Sub-Area North - Proposed Mixed Use Development  
Rochester, New York  
Pre-development Assessment, 4403.0

Dear Mr. Danzinger:

This report summarizes our Pre-development Assessment for the mixed use development on multiple parcels on Silver Street, Kensington Street, Brown Street, West Main Street, and York Street in Rochester, New York. We understand that the City of Rochester intends to have commercial buildings lining West Main Street, with one or more commercial buildings and paved parking lots to the north. Conceptually, the buildings will be two-story, slab-on-grade structures; the southern building may be notched into the site, with at-grade entrance at differing elevations on the north and south sides. We base this preliminary assessment on our review of U.S.G.S. and N.Y.S.D.O.T. topographic and geologic mapping; EDR/Sanborn Fire Insurance mapping; previous subsurface exploration, new soil probe, test pit, and test boring exploration; laboratory test results; and consultation with the design team. Day Environmental, Inc. (DAY) commissioned this study on behalf of the City of Rochester. We intend this report for use exclusively on this project.

The Bullshead High Priority Sub-Area North lies north of West Main Street in Rochester, New York. A *General Location Plan* on 2016 U.S.G.S. topographic mapping is attached to this report. The development is generally bounded by York Street on the west, Silver Street, Brown Street and

Day Environmental, Inc.  
June 20, 2019  
Page 2

Kensington Street to the north and east (refer to Figure 1). Ruby Place, a small alley, extends into the parcel off York Street. It lies between a residential neighborhood and commercial buildings along West Main Street.

The site includes 28 different parcels (refer to Figure 1). As part of this investigation, we reviewed EDR/Sanborn Fire Insurance mapping and 1910 City of Rochester Plat mapping by Hopkins. This mapping shows old building footprints previously located on the parcel(s) (see 1910 mapping enclosed). These parcels were formerly developed by residential housing and commercial buildings. The residential homes and commercial buildings likely had basements and/or split level entrances. These structures were demolished at various times and by various contractors.

The recent exploration program consisted of 25 test pits, twenty-seven soil probes, and eight soil/rock borings at locations agreed upon in advanced between DAY and Foundation Design, P.C. DAY established the investigation locations in the field. An *Investigation Locations* map, showing the recent test pit, soil probe and soil/rock boring locations, and copies of the DAY logs are attached to this report.

Nature's Way excavated test pits TP-01 through TP-25 on February 15, February 16, and April 20, 2018. They provided a Komatsu PC40R mini-excavator for the test pit work. Your staff logged the subsurface profiles. Our staff spot checked the test pit excavations to verify that adequate geotechnical design information was being recorded. The test pit excavations ranged from 3.5 to 10.0 feet deep.

Nature's Way performed soil probes TB-01 through TB-24 between February 12 and February 13, 2018, returning to the site on March 1, 2018 to perform soil probes TB-25, TB-26, and TB-27. For

Day Environmental, Inc.  
June 20, 2019  
Page 3

TB-01 through TB-24, they provided a Geoprobe direct push unit and a four foot long macro-core barrel was used to recover the soil samples. For TB-25 to TB-27, they provided a rotary drill, recovering two-foot long SPT soil samples. Your staff logged the subsurface profiles. Our staff spot checked the soil probe sampling to verify that adequate geotechnical design information was being recorded. The soil probes ranged from 3.0 to 15.8 feet deep.

Nature's Way performed test borings at MW-01 through MW-08. They advanced the borings using hollow stem auger casings, recovering SPT soil samples continuously to auger refusal. The drillers used compressed air to recover the ten foot rock cores. Your staff logged the subsurface profiles. Our staff spot checked the soil probe sampling to verify that adequate geotechnical design information was being recorded.

Other soil information was available for our review for this report. This information included the following soil probe data; locations are added to the *Investigation Locations* mapping.

- 2017 Day Environmental, Inc. soil probes TB-1 through TB-4 performed at 5 Kensington Street.
- 2017 Day Environmental, Inc. soil probes TB-1 through TB-4 performed at 50 York Street.

The following interpretations of the soil, bedrock, and groundwater conditions are based on widely spaced test pits, soil probes, and rock cores; our site observations; and prior work in the area. Variations from the inferred subsurface profile are possible, especially on this filled and previously disturbed site. See the logs attached for soil descriptions at the test locations. Call us immediately if such variations are found during construction so we may evaluate the impact on our recommendations, the design plans, and the specifications.

Day Environmental, Inc.  
June 20, 2019  
Page 4

A typical subsurface profile is expected to consist of fill material over old marsh deposits or glacial till, then bedrock. The fill material encountered is highly variable across the parcel and has likely been placed at different times. We found areas where 'clean' earth, generally free of debris; these areas are limited and tend to be within recently backfilled basements. In other locations, the fills are of marginal to poor quality, where earth fill is mixed with up to ten percent building debris. Older fill deposits contain very poor quality fills material, with 40 to 60 percent building debris (concrete, brick, metal). A large area in the center of the site (Lot 42 York Street) contains very poor quality loose ash/cinder laden fill material. The fills extend up to 11 feet deep; we believe that old foundation walls and basement floor slabs were encountered at the bottom of the fill at several of the old building locations.

Old marsh deposits underlie the fill in the center of the parcel. This formation consists of soft organic silts under the fills at TP-02, TP-14, TB-02, TB-06, TB-14, and TB-21; we suspect that this layer is intermixed with the fill at other locations. In general, this formation extended to the bedrock surface, where present.

The underlying soils consist of a loose to firm silt and sand (glacial lake deposit) and/or a firm to dense red-brown silty sand with gravel, a glacial till formation. These layers tend to be less than four feet thick. The till formation contains cobble and boulder size bedrock fragments.

Several of the soil probes and the eight test borings were advanced to the bedrock surface. We identified the bedrock as the Lockport Group of Formations (aka Eramosa Formation). These formations consists of hard, massive dolomites. Auger/macro-core sampler refusal occurred at depths ranging from 3.9 to 15.8 feet below grade (between elevation 523 and 538).

Day Environmental, Inc.  
June 20, 2019  
Page 5

A large step occurs in the bedrock close to West Main Street. The triangular parcel at 842-848 West Main Street has bedrock within five feet of the surface. Bedrock is shallow north of the RRHS/St. Mary's Hospital facility. Yet, on the lower 42 York Street parcel, bedrock is over 10 feet below grade, resulting in a 20 foot (or more) transition in the bedrock surface.

Where bedrock was cored, the rock contained high and low angle fractures and was pitted with calcite-rich vugs. The RQD measurements of the rock cores ranged from 45 to 85 percent, slightly lower than normal for this formation. The percent recovered ranged from 94 to 100 percent, within the typical values expected for the formation.

Groundwater levels were documented in the monitoring wells (MW-locations) installed in the overburden and bedrock. A *Potentiometric Groundwater Contour Map*, showing the water surface elevations and flow direction, is enclosed. The bedrock surface drops from elevation 537 near West Main Street to elevation 531 along Ruby Place.

We offer the following thoughts as you proceed with your conceptual planning:

- We conclude that the in-place fill is not suitable to support the foundations or floors for the new structure(s). The variable fill quality will result in erratic amounts of settlement as the fill continues to consolidate under its own weight. Organic matter within the fill will decompose with time, resulting in more settlement.

If constructed over this fill material, it is our opinion that floors and foundations would settle. This would result in unacceptable amounts of distress in masonry walls and building framing. Similar problems would be experienced by floors constructed over the fill. Floors would settle erratically, resulting in wavy, uneven, settled, and severely cracked surfaces.

- Depending on site grades and finished floor grades, appropriate foundation approaches will vary. For conceptual planning, we suggest locating the commercial buildings along West Main Street and designing the Police Station as a free standing structure, located as far

north on the parcel as possible. Under this approach, we believe that removal of the in-place fill material and replacement with imported structure fill would be required for the building areas.

Any structure located in the center of the parcel (i.e., into the filled portion of 42 York Street) will require a deep foundation solution due to the highly compressible ash fill present. If an interconnected structure is used, foundations for the commercial building may require dropping the foundations to bear on bedrock to control differential settlement between spread footing supported commercial building and pile-supported Police Station.

It is recommended that the bedrock surface elevations/refusal depths at the test hole locations be reviewed when establishing level floor grade for the commercial building along West Main Street. Bedrock conflicts are possible. If bedrock is encountered, hoe-ramming or blasting would be required to remove the bedrock.

- Where the fill is completely removed and replaced from building areas, standard slab-on-grade construction can be utilized. In areas where deep foundations are used to span over the in-place fill, structural floor slabs will be required, supported by deep foundations and grade beams. Where a structural slab is used, plan to hang the sub-floor utilities from the bottom of the structural slab.
- NYS Building Code identifies various seismic design criteria for this project. We recommend using a Site Classification of D (Stiff Soil Profile). Based on the ASCE 7-10 guidelines, we recommend using the following seismic design parameters for this Risk Category IV structure.

<b>Table No. 1 – Seismic Design Parameters – ASCE 7-10</b>					
<b>Spectral Response Acceleration</b>		<b>Soil Factors</b>		<b>Design Spectral Response Acceleration</b>	
<b>S<sub>s</sub></b>	<b>S<sub>1</sub></b>	<b>S<sub>MS</sub></b>	<b>S<sub>M1</sub></b>	<b>SD<sub>s</sub></b>	<b>SD<sub>1</sub></b>
0.165g	0.060g	0.263g	0.143g	0.176g	0.095g

If you progress your design using ASCE 7-16 guidelines, we recommend using the following seismic design parameters for this Risk Category IV structure.

<b>Table No. 2 – Seismic Design Parameters – ASCE 7-16</b>					
<b>Spectral Response Acceleration</b>		<b>Soil Factors</b>		<b>Design Spectral Response Acceleration</b>	
<b>S<sub>s</sub></b>	<b>S<sub>1</sub></b>	<b>S<sub>MS</sub></b>	<b>S<sub>M1</sub></b>	<b>SD<sub>s</sub></b>	<b>SD<sub>1</sub></b>
0.165g	0.048g	0.259g	0.116g	0.172g	0.077g

- Due to the depth of the in-place fill deposits, removal and replacement of the fill from under pavements is not practical. Since the new pavements will be supported by the in-place fill material, we suggest salvaging material removed from the building areas to raise grades for parking lots. This may require sorting out areas with high brick, ash, concrete, and wood concentrations.

Recognize that where new pavements are constructed over the in-place fill material, wavy, uneven, settled, and severely cracked surfaces are likely to develop long term. We recommend accepting the risk with long-term performance and incorporating measures into the pavement design to mitigate this risk. For conceptual planning, we recommend budgeting based on the Standard and Heavy Duty pavement sections tabulated below.

<b>Table No. 3 - Standard Section</b>		
1.5"	Asphalt Topcoat	NYSDOT Item 403.178902
2.5"	Asphalt Binder	NYSDOT Item 403.138902
12.0"	Crusher-run Stone Subbase	NYSDOT Item 304.12
	Bi-axial Geogrid	Tensar BX-1200
	Subgrade	Approved Proof Roll

<b>Table No. 4 – Heavy Duty Section</b>		
1.5"	Asphalt Topcoat	NYSDOT Item 403.198902
2.5"	Asphalt Binder	NYSDOT Item 403.138902
15.0"	Crusher-run Stone Subbase	NYSDOT Item 304.12
	Bi-axial Geogrid	Tensar BX-1200
	Subgrade	Approved Proof Roll

We recommend sloping both the pavement surface and subgrade at slopes of at least 2.0 percent to facilitate water flow toward the stormwater system and prolong the pavement life. Drainage of the subbase is critical to proper performance of the pavements. Install 25

Day Environmental, Inc.

June 20, 2019

Page 8

foot long weeps off the storm inlets at low points to allow water out of the stone subbase and into the storm water system.

Attached to the end of this text is a Geoprofessional Business Association paper entitled *Important Information about Your Geotechnical Engineering Report* that you should read. It describes how we intend this report to be used and discusses risks and risk allocation. We will continue to work cooperatively with you and other interested parties to achieve win/win solutions.

This concludes our design phase services. We are available to answer questions that you may have about the data or interpretations of the soil, bedrock, and groundwater conditions and to review near-final plans and specifications. We look forward to hearing from you again as the project proceeds toward construction.

Very truly yours,

**FOUNDATION DESIGN, P.C.**

Shawn C. Allen, P.E

Jeffrey D. Netzband, P.E., P.G.  
Vice President  
Enc.

# Important Information about This

# Geotechnical-Engineering Report

Subsurface problems are a principal cause of construction delays, cost overruns, claims, and disputes.

While you cannot eliminate all such risks, you can manage them. The following information is provided to help.

**The Geoprofessional Business Association (GBA) has prepared this advisory to help you – assumedly a client representative – interpret and apply this geotechnical-engineering report as effectively as possible. In that way, clients can benefit from a lowered exposure to the subsurface problems that, for decades, have been a principal cause of construction delays, cost overruns, claims, and disputes. If you have questions or want more information about any of the issues discussed below, contact your GBA-member geotechnical engineer. Active involvement in the Geoprofessional Business Association exposes geotechnical engineers to a wide array of risk-confrontation techniques that can be of genuine benefit for everyone involved with a construction project.**

## **Geotechnical-Engineering Services Are Performed for Specific Purposes, Persons, and Projects**

Geotechnical engineers structure their services to meet the specific needs of their clients. A geotechnical-engineering study conducted for a given civil engineer will not likely meet the needs of a civil-works constructor or even a different civil engineer. Because each geotechnical-engineering study is unique, each geotechnical-engineering report is unique, prepared *solely* for the client. *Those who rely on a geotechnical-engineering report prepared for a different client can be seriously misled.* No one except authorized client representatives should rely on this geotechnical-engineering report without first conferring with the geotechnical engineer who prepared it. *And no one – not even you – should apply this report for any purpose or project except the one originally contemplated.*

## **Read this Report in Full**

Costly problems have occurred because those relying on a geotechnical-engineering report did not read it *in its entirety*. Do not rely on an executive summary. Do not read selected elements only. *Read this report in full.*

## **You Need to Inform Your Geotechnical Engineer about Change**

Your geotechnical engineer considered unique, project-specific factors when designing the study behind this report and developing the confirmation-dependent recommendations the report conveys. A few typical factors include:

- the client's goals, objectives, budget, schedule, and risk-management preferences;
- the general nature of the structure involved, its size, configuration, and performance criteria;
- the structure's location and orientation on the site; and
- other planned or existing site improvements, such as retaining walls, access roads, parking lots, and underground utilities.

Typical changes that could erode the reliability of this report include those that affect:

- the site's size or shape;
- the function of the proposed structure, as when it's changed from a parking garage to an office building, or from a light-industrial plant to a refrigerated warehouse;
- the elevation, configuration, location, orientation, or weight of the proposed structure;
- the composition of the design team; or
- project ownership.

As a general rule, *always* inform your geotechnical engineer of project changes – even minor ones – and request an assessment of their impact. *The geotechnical engineer who prepared this report cannot accept responsibility or liability for problems that arise because the geotechnical engineer was not informed about developments the engineer otherwise would have considered.*

## **This Report May Not Be Reliable**

*Do not rely on this report* if your geotechnical engineer prepared it:

- for a different client;
- for a different project;
- for a different site (that may or may not include all or a portion of the original site); or
- before important events occurred at the site or adjacent to it; e.g., man-made events like construction or environmental remediation, or natural events like floods, droughts, earthquakes, or groundwater fluctuations.

Note, too, that it could be unwise to rely on a geotechnical-engineering report whose reliability may have been affected by the passage of time, because of factors like changed subsurface conditions; new or modified codes, standards, or regulations; or new techniques or tools. *If your geotechnical engineer has not indicated an "apply-by" date on the report, ask what it should be, and, in general, if you are the least bit uncertain about the continued reliability of this report, contact your geotechnical engineer before applying it.* A minor amount of additional testing or analysis – if any is required at all – could prevent major problems.

## **Most of the "Findings" Related in This Report Are Professional Opinions**

Before construction begins, geotechnical engineers explore a site's subsurface through various sampling and testing procedures. *Geotechnical engineers can observe actual subsurface conditions only at those specific locations where sampling and testing were performed.* The data derived from that sampling and testing were reviewed by your geotechnical engineer, who then applied professional judgment to form opinions about subsurface conditions throughout the site. Actual site-wide-subsurface conditions may differ – maybe significantly – from those indicated in this report. Confront that risk by retaining your geotechnical engineer to serve on the design team from project start to project finish, so the individual can provide informed guidance quickly, whenever needed.

## This Report's Recommendations Are Confirmation-Dependent

The recommendations included in this report – including any options or alternatives – are confirmation-dependent. In other words, *they are not final*, because the geotechnical engineer who developed them relied heavily on judgment and opinion to do so. Your geotechnical engineer can finalize the recommendations *only after observing actual subsurface conditions* revealed during construction. If through observation your geotechnical engineer confirms that the conditions assumed to exist actually do exist, the recommendations can be relied upon, assuming no other changes have occurred. *The geotechnical engineer who prepared this report cannot assume responsibility or liability for confirmation-dependent recommendations if you fail to retain that engineer to perform construction observation.*

## This Report Could Be Misinterpreted

Other design professionals' misinterpretation of geotechnical-engineering reports has resulted in costly problems. Confront that risk by having your geotechnical engineer serve as a full-time member of the design team, to:

- confer with other design-team members,
- help develop specifications,
- review pertinent elements of other design professionals' plans and specifications, and
- be on hand quickly whenever geotechnical-engineering guidance is needed.

You should also confront the risk of constructors misinterpreting this report. Do so by retaining your geotechnical engineer to participate in prebid and preconstruction conferences and to perform construction observation.

## Give Constructors a Complete Report and Guidance

Some owners and design professionals mistakenly believe they can shift unanticipated-subsurface-conditions liability to constructors by limiting the information they provide for bid preparation. To help prevent the costly, contentious problems this practice has caused, include the complete geotechnical-engineering report, along with any attachments or appendices, with your contract documents, *but be certain to note conspicuously that you've included the material for informational purposes only.* To avoid misunderstanding, you may also want to note that "informational purposes" means constructors have no right to rely on the interpretations, opinions, conclusions, or recommendations in the report, but they may rely on the factual data relative to the specific times, locations, and depths/elevations referenced. Be certain that constructors know they may learn about specific project requirements, including options selected from the report, *only* from the design drawings and specifications. Remind constructors that they may

perform their own studies if they want to, and *be sure to allow enough time* to permit them to do so. Only then might you be in a position to give constructors the information available to you, while requiring them to at least share some of the financial responsibilities stemming from unanticipated conditions. Conducting prebid and preconstruction conferences can also be valuable in this respect.

## Read Responsibility Provisions Closely

Some client representatives, design professionals, and constructors do not realize that geotechnical engineering is far less exact than other engineering disciplines. That lack of understanding has nurtured unrealistic expectations that have resulted in disappointments, delays, cost overruns, claims, and disputes. To confront that risk, geotechnical engineers commonly include explanatory provisions in their reports. Sometimes labeled "limitations," many of these provisions indicate where geotechnical engineers' responsibilities begin and end, to help others recognize their own responsibilities and risks. *Read these provisions closely.* Ask questions. Your geotechnical engineer should respond fully and frankly.

## Geoenvironmental Concerns Are Not Covered

The personnel, equipment, and techniques used to perform an environmental study – e.g., a "phase-one" or "phase-two" environmental site assessment – differ significantly from those used to perform a geotechnical-engineering study. For that reason, a geotechnical-engineering report does not usually relate any environmental findings, conclusions, or recommendations; e.g., about the likelihood of encountering underground storage tanks or regulated contaminants. *Unanticipated subsurface environmental problems have led to project failures.* If you have not yet obtained your own environmental information, ask your geotechnical consultant for risk-management guidance. As a general rule, *do not rely on an environmental report prepared for a different client, site, or project, or that is more than six months old.*

## Obtain Professional Assistance to Deal with Moisture Infiltration and Mold

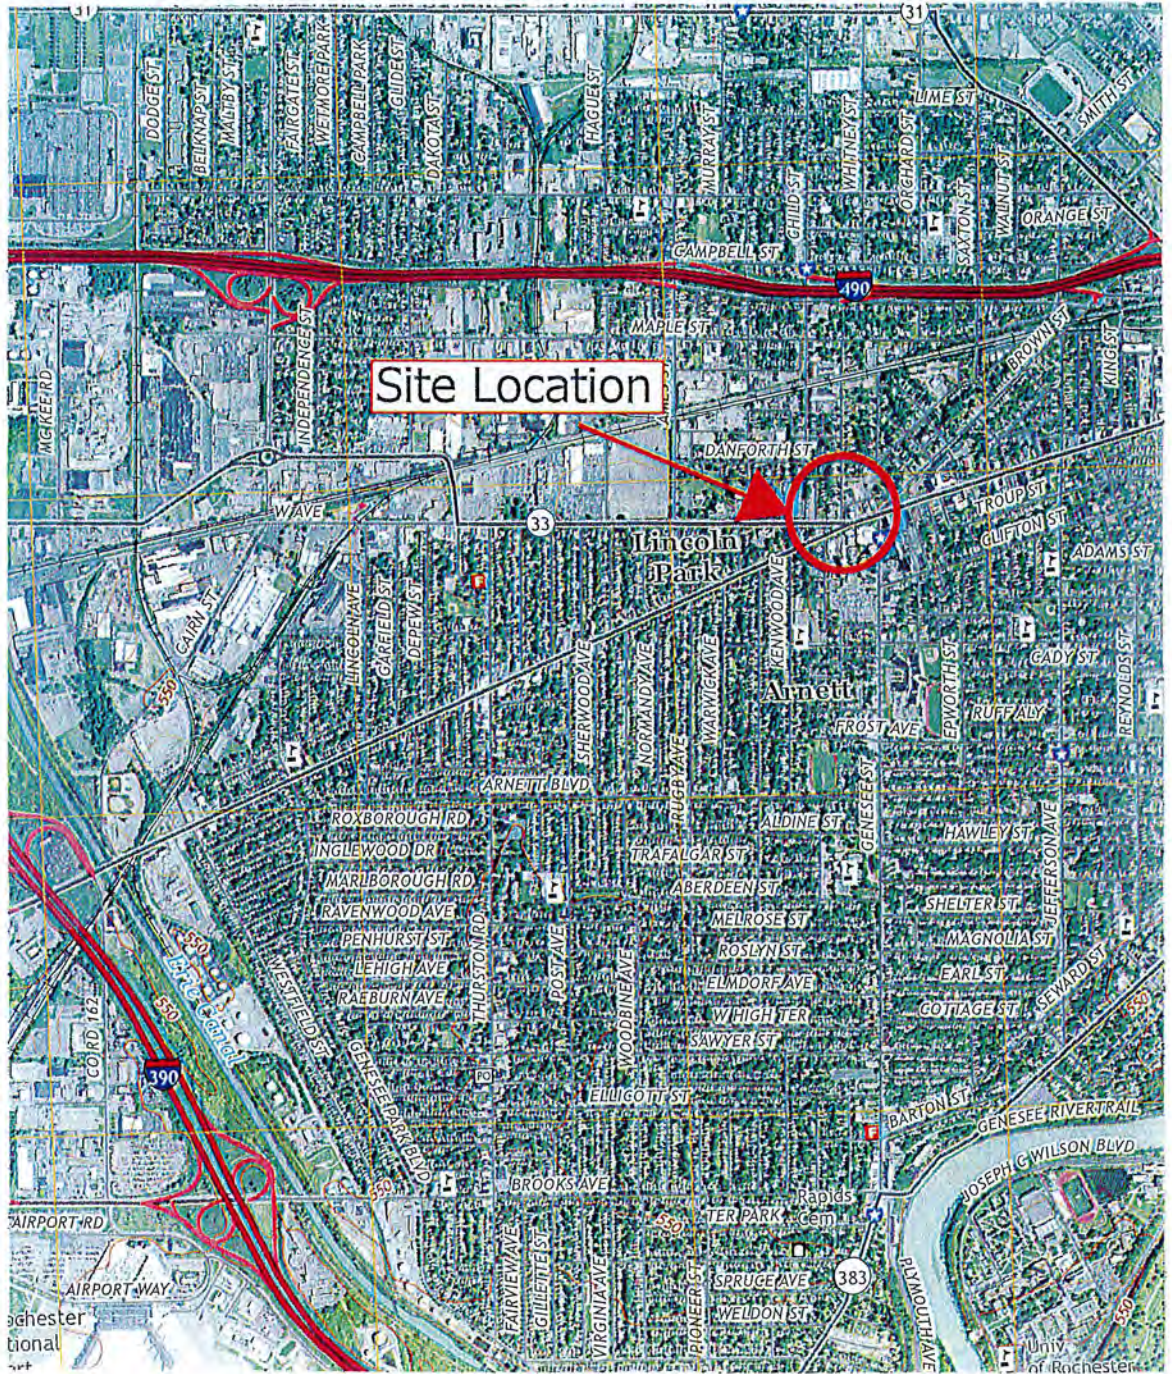

While your geotechnical engineer may have addressed groundwater, water infiltration, or similar issues in this report, none of the engineer's services were designed, conducted, or intended to prevent uncontrolled migration of moisture – including water vapor – from the soil through building slabs and walls and into the building interior, where it can cause mold growth and material-performance deficiencies. Accordingly, *proper implementation of the geotechnical engineer's recommendations will not of itself be sufficient to prevent moisture infiltration.* Confront the risk of moisture infiltration by including building-envelope or mold specialists on the design team. *Geotechnical engineers are not building-envelope or mold specialists.*

 DAY Representative: D. Peck  
 Contractor: Nature's Way  
 Equipment: Komatsu PC40R Mini-Excavator

Date: 4/20/2018  
 Test Pit Depth: 6.0'  
 Depth to Water: Not Encountered

TEST PIT TP-25

Page 1 of 1

Depth (ft)	PID Reading (ppm)	Samples Collected	PID Headspace (ppm)	Sample Description	Notes
1-	0.0			Topsoil	
2-	0.0			Compact, Tan, medium Sand, trace rounded Gravel, moist (FILL)	
3-	0.0	S-1	NA		Stable sidewalls
4-	0.0				
5-	0.0				
6-	0.0			Refusal @ 6.0'	Slightly irregular hard surface
7-					
8-					
9-					
10-					
11-					
12-					
13-					
14-					
15-					
16-					

Notes: 1) Water levels were made at the times and under conditions stated. Fluctuations of groundwater levels may occur due to seasonal factors and other conditions.  
 2) Stratification lines represent approximate boundaries. Transitions may be gradual.  
 3) PID readings are referenced to a benzene standard measured in the headspace above the sample using a MiniRae 2000 equipped with a 10.6 eV lamp.  
 4) NA = Not Available or Not Applicable

**Environmental Analytical Laboratory Reports**

March 02, 2018

Service Request No:R1801334

Mr. Jeff Danzinger  
Day Environmental, Incorporated  
1563 Lyell Avenue  
Rochester, NY 14606

**Laboratory Results for: Bulls Head North, Rochester, NY**

Dear Mr.Danzinger,

Enclosed are the results of the sample(s) submitted to our laboratory February 14, 2018  
For your reference, these analyses have been assigned our service request number **R1801334**.

All analyses were performed according to our laboratory's quality assurance program. The test results meet requirements of the NELAP standards except as noted in the case narrative report. All results are intended to be considered in their entirety, and ALS Environmental is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report. The measurement uncertainty of the results included in this report is within that expected when using the prescribed method(s) for analysis of these samples, and represented by Laboratory Control Sample control limits. Any events, such as QC failures, which may add to the uncertainty are explained in the report narrative.

Respectfully submitted,

**ALS Group USA, Corp. dba ALS Environmental**

Brady Kalkman  
Project Manager

**Client:** Day Environmental, Incorporated  
**Project:** Bulls Head North, Rochester, NY  
**Sample Matrix:** Soil

**Service Request:** R1801334  
**Date Received:** 02/14/2018

### CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples designated for Tier IV, validation deliverables including all summary forms and associated raw data. Analytical procedures performed by the lab are validated in accordance with NELAC standards. Any parameters that are not included in the lab's NELAC accreditation are identified on a "Non-Certified Analytes" report in the Miscellaneous Forms Section of this report. Individual analytical results requiring further explanation are flagged with qualifiers and/or discussed below. The flags are explained in the Report Qualifiers and Definitions page in the Miscellaneous Forms section of this report.

#### Sample Receipt:

Fourteen soil samples were received for analysis at ALS Environmental on 02/14/2018. Any discrepancies noted upon initial sample inspection are noted on the cooler receipt and preservation form included in this data package. The samples were received in good condition and consistent with the accompanying chain of custody form. Samples are refrigerated at 6°C upon receipt at the lab except for aqueous samples designated for metals analyses, which are stored at room temperature.

#### Semivolatiles by GC/MS:

Method 8270D, 02/22/2018: The upper control limit was exceeded for one or more analytes in the Continuing Calibration Verification (CCV). The field samples analyzed in this sequence did not contain the analyte(s) in question above the Method Reporting Limit (MRL). Since the exceedance equates to a potential high bias, the data quality was not significantly affected and no further corrective action was taken.

Method 8270D, R1801334-003: Sample(s) required dilution due to the dark oily nature of the extract. The reporting limits are adjusted to reflect the dilution.

Method 8270D, 02/21/2018: The lower control limit was exceeded for one or more analytes in the Continuing Calibration Verification (CCV). Since there were no detections of the analyte(s) in the associated field samples, the quantitation is not affected. The data quality was not significantly affected and no further corrective action was taken.

#### Semivolatile GC:

No significant anomalies were noted with this analysis.

#### Metals:

No significant anomalies were noted with this analysis.

#### General Chemistry:

No significant anomalies were noted with this analysis.

#### Volatiles by GC/MS:

Method 8260C, 02/16/2018: The lower control limit was exceeded for one or more analytes in the Continuing Calibration Verification (CCV). Since there were no detections of the analyte(s) in the associated field samples, the quantitation is not affected. The data quality was not significantly affected and no further corrective action was taken.

Method 8260C, R1801334-004: The control limits were exceeded for one or more surrogates due to matrix interferences. A re-extraction and reanalysis was performed, but produced similar results. No further corrective action was required. The reanalysis' surrogates passed (still on low side), however it had carry over from previous analysis. Use for confirmation only.

Method 8260C, 02/20/2018: The upper control limit was exceeded for one or more analytes in the Continuing Calibration Verification (CCV). The field samples analyzed in this sequence did not contain the analyte(s) in question above the Method Reporting Limit (MRL). Since the exceedance equates to a potential high bias, the data quality was not significantly affected and

Approved by 

Date 03/02/2018

no further corrective action was taken.

# Cooler Receipt and Preservation Check For

R1801334

5

Day Environmental, Incorporated  
Bulls Head North, Rochester, NY

Project/Client Day Environmental Folder Number R18-1334

Cooler received on 2/14/18 by: DLW

COURIER: ALS UPS FEDEX VELOCITY CLIENT

1	Were <b>Custody seals</b> on outside of cooler?	Y <input checked="" type="checkbox"/> N
2	<b>Custody papers</b> properly completed (ink, signed)?	Y <input checked="" type="checkbox"/> N
3	Did all bottles arrive in good <b>condition</b> (unbroken)?	Y <input checked="" type="checkbox"/> N
4	Circle: <del>Wet Ice</del> <b>Dry Ice</b> <b>Gel packs</b> present?	Y <input checked="" type="checkbox"/> N

5a	<b>Perchlorate</b> samples have required headspace?	Y N <u>NA</u>
5b	Did VOA vials, Alk, or Sulfide have sig* <b>bubbles</b> ?	Y N <u>NA</u>
6	Where did the bottles originate?	<u>ALS/ROC</u> CLIENT
7	Soil VOA received as: Bulk Encore <u>5035set</u> NA	

8. Temperature Readings Date: 2/14/18 Time: 1710 ID: IR#7 IR#9 From: Temp Blank Sample Bottle

Observed Temp (°C)	<u>5.6</u>							
Correction Factor (°C)	<u>±0.0</u>							
Corrected Temp (°C)	<u>5.6</u>							
Temp from: Type of bottle								
Within 0-6°C?	<input checked="" type="checkbox"/> N	Y N	Y N	Y N	Y N	Y N	Y N	Y N
If <0°C, were samples frozen?	Y N	Y N	Y N	Y N	Y N	Y N	Y N	Y N

If out of Temperature, note packing/ice condition: \_\_\_\_\_ Ice melted Poorly Packed (described below) Same Day Rule  
& Client Approval to Run Samples: \_\_\_\_\_ Standing Approval Client aware at drop-off Client notified by: \_\_\_\_\_

All samples held in storage location: Room by DLW on 2/14/18 at 1710  
5035 samples placed in storage location: R-Fox by J on V at J

Cooler Breakdown: Date: 2/15/18 Time: 1612 by: DLW

- 9. Were all bottle labels complete (i.e. analysis, preservation, etc.)? YES NO
- 10. Did all bottle labels and tags agree with custody papers? YES NO
- 11. Were correct containers used for the tests indicated? YES NO
- 12. Were 5035 vials acceptable (no extra labels, not leaking)? YES NO N/A
- 13. Air Samples: Cassettes / Tubes Intact Canisters Pressurized Tedlar® Bags Inflated N/A

pH	Lot of test paper	Reagent	Preserved?		Lot Received	Exp	Sample ID	Vol. Added	Lot Added	Final pH
			Yes	No						
≥12		NaOH								
≤2		HNO <sub>3</sub>								
≤2		H <sub>2</sub> SO <sub>4</sub>								
<4		NaHSO <sub>4</sub>								
Residual Chlorine (-)		For CN Phenol and 522			If +, contact PM to add Na <sub>2</sub> S <sub>2</sub> O <sub>3</sub> (CN), ascorbic (phenol).					
		Na <sub>2</sub> S <sub>2</sub> O <sub>3</sub>	-	-						
		ZnAcetate	-	-						
		HCl	**	**						

\*\*Not to be tested before analysis – pH tested and recorded by VOAs on a separate worksheet

Bottle lot numbers: 042411 042417-158

Explain all Discrepancies/Other Comments: DLW 2/15/18

CLRES	BULK
DO	FLDT
HPROD	HGFB
HTR	LL3541
PH	SUB
SO3	MARRS
ALS	REV

Labels secondary reviewed by: DLW  
PC Secondary Review: \_\_\_\_\_

\*significant air bubbles: VOA > 5-6 mm : WC > 1 in. diameter

## REPORT QUALIFIERS AND DEFINITIONS

<p><b>U</b> Analyte was analyzed for but not detected. The sample quantitation limit has been corrected for dilution and for percent moisture, unless otherwise noted in the case narrative.</p> <p><b>J</b> Estimated value due to either being a Tentatively Identified Compound (TIC) or that the concentration is between the MRL and the MDL. Concentrations are not verified within the linear range of the calibration. For DoD: concentration &gt;40% difference between two GC columns (pesticides/Aroclors).</p> <p><b>B</b> Analyte was also detected in the associated method blank at a concentration that may have contributed to the sample result.</p> <p><b>E</b> Inorganics- Concentration is estimated due to the serial dilution was outside control limits.</p> <p><b>E</b> Organics- Concentration has exceeded the calibration range for that specific analysis.</p> <p><b>D</b> Concentration is a result of a dilution, typically a secondary analysis of the sample due to exceeding the calibration range or that a surrogate has been diluted out of the sample and cannot be assessed.</p> <p><b>*</b> Indicates that a quality control parameter has exceeded laboratory limits. Under the "Notes" column of the Form I, this qualifier denotes analysis was performed out of Holding Time.</p> <p><b>H</b> Analysis was performed out of hold time for tests that have an "immediate" hold time criteria.</p> <p><b>#</b> Spike was diluted out.</p>	<p><b>+</b> Correlation coefficient for MSA is &lt;0.995.</p> <p><b>N</b> Inorganics- Matrix spike recovery was outside laboratory limits.</p> <p><b>N</b> Organics- Presumptive evidence of a compound (reported as a TIC) based on the MS library search.</p> <p><b>S</b> Concentration has been determined using Method of Standard Additions (MSA).</p> <p><b>W</b> Post-Digestion Spike recovery is outside control limits and the sample absorbance is &lt;50% of the spike absorbance.</p> <p><b>P</b> Concentration &gt;40% difference between the two GC columns.</p> <p><b>C</b> Confirmed by GC/MS</p> <p><b>Q</b> DoD reports: indicates a pesticide/Aroclor is not confirmed (&gt;100% Difference between two GC columns).</p> <p><b>X</b> See Case Narrative for discussion.</p> <p><b>MRL</b> Method Reporting Limit. Also known as:</p> <p><b>LOQ</b> Limit of Quantitation (LOQ) The lowest concentration at which the method analyte may be reliably quantified under the method conditions.</p> <p><b>MDL</b> Method Detection Limit. A statistical value derived from a study designed to provide the lowest concentration that will be detected 99% of the time. Values between the MDL and MRL are estimated (see J qualifier).</p> <p><b>LOD</b> Limit of Detection. A value at or above the MDL which has been verified to be detectable.</p> <p><b>ND</b> Non-Detect. Analyte was not detected at the concentration listed. Same as U qualifier.</p>

### Rochester Lab ID # for State Certifications<sup>1</sup>

Connecticut ID # PH0556	Maine ID #NY0032	New Hampshire ID #
Delaware Approved	New Jersey ID # NY004	294100 A/B
DoD ELAP #65817	New York ID # 10145	Pennsylvania ID# 68-786
Florida ID # E87674	North Carolina #676	Rhode Island ID # 158
		Virginia #460167

<sup>1</sup> Analyses were performed according to our laboratory's NELAP-approved quality assurance program and any applicable state or agency requirements. The test results meet requirements of the current NELAP/TNI standards or state or agency requirements, where applicable, except as noted in the case narrative. Since not all analyte/method/matrix combinations are offered for state/NELAC accreditation, this report may contain results which are not accredited. For a specific list of accredited analytes, contact the laboratory or go to <https://www.alsglobal.com/locations/americas/north-america/usa/new-york/rochester-environmental>

## Acronyms

ASTM	American Society for Testing and Materials
A2LA	American Association for Laboratory Accreditation
CARB	California Air Resources Board
CAS Number	Chemical Abstract Service registry Number
CFC	Chlorofluorocarbon
CFU	Colony-Forming Unit
DEC	Department of Environmental Conservation
DEQ	Department of Environmental Quality
DHS	Department of Health Services
DOE	Department of Ecology
DOH	Department of Health
EPA	U. S. Environmental Protection Agency
ELAP	Environmental Laboratory Accreditation Program
GC	Gas Chromatography
GC/MS	Gas Chromatography/Mass Spectrometry
LUFT	Leaking Underground Fuel Tank
M	Modified
MCL	Maximum Contaminant Level is the highest permissible concentration of a substance allowed in drinking water as established by the USEPA.
MDL	Method Detection Limit
MPN	Most Probable Number
MRL	Method Reporting Limit
NA	Not Applicable
NC	Not Calculated
NCASI	National Council of the Paper Industry for Air and Stream Improvement
ND	Not Detected
NIOSH	National Institute for Occupational Safety and Health
PQL	Practical Quantitation Limit
RCRA	Resource Conservation and Recovery Act
SIM	Selected Ion Monitoring
TPH	Total Petroleum Hydrocarbons
tr	Trace level is the concentration of an analyte that is less than the PQL but greater than or equal to the MDL.

## INORGANIC PREPARATION METHODS

The preparation methods associated with this report are found in these tables unless discussed in the case narrative.

### Water/Liquid Matrix

Analytical Method	Preparation Method
200.7	200.2
200.8	200.2
6010C	3005A/3010A
6020A	ILM05.3
9014 Cyanide Reactivity	SW846 Ch7, 7.3.4.2
9034 Sulfide Reactivity	SW846 Ch7, 7.3.4.2
9034 Sulfide Acid Soluble	9030B
9056A Bomb (Halogens)	5050A
9066 Manual Distillation	9065
SM 4500-CN-E Residual Cyanide	SM 4500-CN-G
SM 4500-CN-E WAD Cyanide	SM 4500-CN-I

### Solid/Soil/Non-Aqueous Matrix

Analytical Method	Preparation Method
6010C	3050B
6020A	3050B
6010C TCLP (1311) extract	3005A/3010A
6010 SPLP (1312) extract	3005A/3010A
7196A	3060A
7199	3060A
9056A Halogens/Halides	5050
300.0 Anions/ 350.1/ 353.2/ SM 2320B/ SM 5210B/ 9056A Anions	DI extraction

For analytical methods not listed, the preparation method is the same as the analytical method reference.
