FIGURES AND TABLES

I. INTRODUCTION

This study is being performed in support of the Design Approval Document prepared for the City of Rochester PJ# 21117 – 2023 Preventive Maintenance Group 1, PIN 4CR0.13. The purpose of the parking survey (or parking usage study) is to provide details on the efficiency and utilization of existing on-street parking and to evaluate the effects of modifications to on-street parking within the project limits along South Avenue, University Avenue, East Avenue, and Culver Road to include bike lanes. This report presents a summary of the existing parking inventory, survey results, and conclusions.

The need for a parking study was established to determine the effects of a reduction in on-street parking spaces would have on parking utilization. A reduction in spaces would be a direct result of implementing a proposal to include on-street bike lanes along South Avenue, University Avenue, East Avenue, and Culver Road within the project limits.

The Parking Study as shown in Figures 1 - 5 includes the on-street parking (or curbside parking) spaces provided on each side of the street in the study area. Along South Avenue from East Henrietta Road to Elmwood Avenue the majority of the land use is residential. Along University Avenue from Culver Road to Blossom Road there is a mix of retail and restaurant land uses. Along East Avenue from Culver Road to Probert Street there is mostly residential land uses. Culver Road from Garson Avenue to Laurelton Road consists of a mix of residential, retail, and restaurant land uses, whereas Culver Road from Clifford Avenue to Norton Street consists of mostly residential land uses.

II. METHODOLOGY

Parking inventories gather information on the existing parking supply and its use. Parking inventories include observations of the number of parking spaces, their location, and the type of parking facility. To allow for a comprehensive method of evaluating the data the study area is divided into blocks and the inventoried parking locations are recorded into *Tables 1A – 1F*.

A parking (or occupancy) survey was used in analyzing the parking capacity of the study area. Parking occupancy is the total number of vehicles parked at any given time. The purpose of occupancy surveys is to establish variations and peak parking demand.

III. PARKING INVENTORY

An inventory of the number of on-street parking spaces was conducted by Lu Engineers. The number of existing available on-street parking spaces was estimated assuming 20 ft. long spaces, no parking 20 ft. from an intersection, no parking 15 ft. from a fire hydrant and no parking 5 ft. from a driveway. All inventoried spaces are identified with individual block numbers (on-street parking) as shown in *Figures 1 - 5* and *Tables 1A – 1F*. The total number of estimated available on-street parking spaces identified in the study area was 23 on South Avenue, 39 on University Avenue, 155 on East Avenue, 80 on Culver Road from Garson Avenue to Laurelton Road, and 101 on Culver Road from Clifford Avenue to Norton Street.

IV. PARKING SURVEY

The parking survey was performed during the following dates / times:

- Tuesday, February 1, 2022 at 6:30 AM, 10:00 AM, 12:30 PM, 3:00 PM, and 7:00 PM
- Wednesday, February 2, 2022 at 6:30 AM, 10:00 AM, 12:30 PM, 3:00 PM, and 7:00 PM
- Saturday, February 5, 2022 at 2:00 PM
- Tuesday, February 8, 2022 at 6:30 AM, 10:00 AM, 12:30 PM, 3:00 PM, and 7:00 PM
- Thursday, February 10, 2022 at 6:30 AM, 10:00 AM, 12:30 PM, 3:00 PM, and 7:00 PM
- Saturday, February 12, 2022 at 2:00 PM
- Wednesday, February 16, 2022 at 6:30 AM, 10:00 AM, 12:30 PM, 3:00 PM, and 7:00 PM
- Thursday, February 17, 2022 at 6:30 AM, 10:00 AM, 12:30 PM, 3:00 PM, and 7:00 PM
- Saturday, February 19, 2022 at 2:00 PM

An observer traveled a fixed route and recorded the total amount of on-street parking occupied spaces. The parking survey shows the number of vehicles parked in predefined areas during a set time-period. *Tables 1A – 1F: On-Street Parking Utilization* summarize the information for the parking survey for South Avenue (*Table 1A*), University Avenue (*Table 1B*), East Avenue (*Table 1C*), and Culver Road (*Tables 1D – 1F*) within the project limits. It is apparent that the most highly utilized on-street parking areas are along the retail, restaurant, and commercial property blocks. It should be noted that the East Avenue parking study did not include weekday midday counts due to parking restrictions Monday – Friday from 7:00 AM to 6:00 PM.

Combined utilization is defined as the number of vehicles parked throughout the study areas divided by the total number of study hours. For defining practical capacity, it is assumed that 90% of the total spaces will be utilized at one time. Maximum utilization is defined as the maximum number of vehicles parked in the defined blocks or areas throughout the study period.

South Avenue On-Street Parking Observations

The following are general observations from Table 1A (South Avenue: On-Street Parking Utilization):

- None of the individual parking block time periods were found to be at practical or full capacity (90% - 100% utilization).
- None of time periods surveyed had a combined utilization of parking spaces of 5% or greater.
- All properties located within this section of South Avenue have driveways that can be used for parking multiple vehicles.

University Avenue On-Street Parking Observations

The following are general observations from Tables 1B (University Avenue: On-Street Parking Utilization):

- None of the individual parking block time periods were found to be at practical or full capacity (90% - 100% utilization).
- Combined utilization over 50% can be noted at the following three (3) study periods:
  - Tuesday at 7:00 PM
  - Wednesday at 12:30 PM and 7:00 PM
- Parking Block 1 from Culver Road to Blossom Road (north side) was found to have a maximum utilization of 72% which was recorded during the Saturday count at 2:00 PM.
- Parking Block 2 from Culver Road to East Boulevard (south side) was found to have a maximum utilization of 64% which was recorded during the Wednesday count at 3:00 PM.
- The on-street parking spaces along University Avenue are typically utilized by motorists accessing the retail, restaurant, and commercial properties throughout the day.
- All properties on this block have off-street parking lots that may be used by motorists.

East Avenue On-Street Parking Observations

Please refer to Table 1C (East Avenue: On-Street Parking Utilization). There were no parked vehicles observed during any time periods throughout the East Avenue project limits, therefore utilization is 0%. Majority of land uses within this section of East Avenue consist of residential properties with driveways or parking lots, which are utilized by motorists.

Culver Road (from Garson Avenue to Laurelton Road) On-Street Parking Observations

The following are general observations from Table 1D & 1E (Culver Road (from Garson Avenue to Laurelton Road): On-Street Parking Utilization):

- On Saturday at 2:00 PM it was observed that four (4) individual parking blocks periods were found to be at practical or full capacity (90% - 100% utilization). The combined utilization during this time period was calculated to be 58%.
- The combined maximum utilization for this section of Culver Road was calculated to be 66% with 53 of 80 total spaces utilized.

Parsells Avenue to Melville Street (Parking Blocks 3 and 14)

The on-street parking spaces are typically utilized by motorists accessing the retail, restaurant, and commercial properties throughout the day. Parking utilization on these blocks tended to decrease to 0% around 7:00 PM on weekdays. On Saturday at 2:00 PM both blocks were 100% utilized by parked vehicles. All properties on this block have driveways that can be used for parking multiple vehicles.

Conklin Avenue to Merchants Road (Parking Blocks 8 and 18)

The on-street parking spaces are typically utilized by motorists accessing the retail, restaurant, and commercial properties throughout the day. Parking utilization on the southern block (parking block 18) tended to increase around 7:00 PM on weekdays. On Saturday at 2:00 PM parking block 8 was fully utilized (100%) and parking block 18 was

above practical capacity, at 93% utilization. All properties on this block have driveways that can be used for parking multiple vehicles.

Culver Road (from Clifford Avenue to Norton Street) On-Street Parking Observations

The following are general observations from Table 1F (Culver Road (from Clifford Avenue to Norton Street): On-Street Parking Utilization):

- None of the individual parking block time periods were found to be above 15% utilization.
- None of time periods surveyed had a combined utilization of parking spaces of 5% or greater.
- All properties located within this section of Culver Road have driveways that can be used for parking multiple vehicles.

V. PROPOSED PARKING AND BIKE LANE ALTERNATIVES

The 2023 Preventive Maintenance Group 1 project proposes changing the current on-street parking configuration at various locations along South Avenue, University Avenue, East Avenue, and Culver Road to allow for bike lanes and vehicle turning lanes. The proposed bike lane and parking configuration is as follows:

South Avenue

The proposed South Avenue plan installs bike lanes from approximately 200 ft. north of Science Parkway to Fort Hill Terrace along the west side of the roadway, connecting into the existing bike lanes. There are 23 existing on-street parking spaces on along South Avenue within the project limits, all of which will be eliminated with the installation of bike lanes. It is anticipated that the elimination of the existing 23 on-street parking spaces will have minor or no impacts because all properties along this section of South Avenue have driveways that can be used for parking multiple vehicles. Refer to *Figure 1 – South Avenue Parking Study* for the proposed bike lane and parking lane configuration.

University Avenue

The proposed University Avenue plan will install a bike lane from Culver Road to approximately 150 ft. east of East Boulevard along the north side of the roadway. Additionally, a bike lane will be installed along the south side of University Avenue beginning at the Culver Road intersection and connecting into the existing bike lane between East Boulevard and Blossom Road. There are 39 existing on-street parking spaces on along University Avenue within the project limits. The installation of the bike lanes will cause 14 parking spaces to be eliminated along the south side of University Avenue in parking block 2. The heavily utilized parking block 1 along the north side of University Avenue will not be impacted by the addition of bike lanes. It is anticipated that the elimination of the existing 14 on-street parking spaces will have minor or no impacts because all properties along this section of South Avenue have driveways or parking lots that can be used for parking multiple vehicles. Refer to *Figure 2 – University Avenue Parking Study* for the proposed bike lane and parking lane configuration.

East Avenue

The proposed East Avenue plan installs bike lanes from Culver Road to approximately 200 ft. east of Colby Street along the north and south sides of the roadway. There are 155 existing on-street parking spaces on along East Avenue within the project limits, all of which will be eliminated with the installation of bike lanes. During the five (5) parking study time periods, on three (3) different days, no vehicles were observed to be parked within the project limits. It is anticipated that the elimination of the existing 155 on-street parking spaces will have minor or no impacts due to the underutilization of the on-street parking. Additionally, all properties along this section of South Avenue have driveways or parking lots that can be used for parking multiple vehicles. Refer to *Figure 3 – East Avenue Parking Study* for the proposed bike lane and parking lane configuration.

Culver Road (from Garson Avenue to Laurelton Road)

The proposed Culver Road plan installs bike lanes from Melville Street to Ferris Street along the north side and from Melville Street to Conklin Avenue along the south side of the roadway. There are 80 existing on-street parking spaces on along this section of Culver Road. The installation of the bike lanes will cause 26 parking spaces to be eliminated along Culver Road, which includes parking blocks 4 – 7, 16, and 17. None of the parking blocks to be eliminated reached practical capacity or full capacity during any of the eleven (11) study periods, on three (3) different days. Of the parking blocks to be eliminated, parking block 7 along the north side of Culver Road from Vermont Street to Ferris Street was the most utilized, with a maximum utilization of 75% (3 out of 4 parking spaces utilized). The second most utilized parking block to be eliminated is parking block 5, on the north side of Culver Road from Hazelwood Terrace to Rosewood Terrace, with a maximum utilization of 67% (2 out of 3 spaces utilized). It is anticipated that the elimination of the existing 26 on-street parking spaces will have minor or no impacts because all properties along this section of Culver Road have driveways or parking lots that can be used for parking multiple vehicles. Refer to *Figure 4 – Culver Road Parking Study* for the proposed bike lane and parking lane configuration.

Culver Road (from Clifford Avenue to Norton Street)

The proposed Culver Road plan installs bike lanes from Waring Road to Norton Street along the north and south sides of the roadway. There are 101 existing on-street parking spaces on along this section of Culver Road. The installation of the bike lanes will cause all parking spaces to be eliminated along the south side of Culver Road from Waring Road to Norton Street (47 spaces), parking blocks 28 – 32. Parking spaces along the north side of Culver Road from Waring Road to Norton Street will be maintained and three (3) additional spaces will be added near a proposed curb bump-out located at the intersection of Culver Road and Densmore/Master Street (parking block 24). None of the parking blocks to be eliminated reached above 15% maximum utilization during any of the eleven (11) study periods, on three (3) different days. It is anticipated that the elimination of the existing 47 on-street parking spaces will have minor or no impacts due to the underutilization of the on-street parking. Additionally, all properties along this section of South Avenue have driveways or parking lots that can be used for parking multiple vehicles. Refer to *Figure 5 – Culver Road Parking Study* for the proposed bike lane and parking lane configuration.

VI. CONCLUSIONS AND RECOMMENDATIONS

The on-street parking spaces within the South Avenue, University Avenue, East Avenue, and Culver Road project limits are not fully utilized except for weekends in isolated retail, restaurant, and commercial property blocks. It does not appear that residents rely upon on-street parking to access their homes because all properties within the study area have driveways or parking lots that can be used for parking multiple vehicles.

The following recommendations are provided for the proposed roadway design.

South Avenue

Due to the observed public's underutilization of on-street parking on South Avenue between East Henrietta Road and Elmwood Avenue it is recommended to include the installation of new bike lanes proposed and shown in *Figure 1 – South Avenue Parking Study*.

University Avenue

Due to the availability of off-street parking lots and driveways that can be used for parking multiple vehicles on University Avenue between Culver Road and Blossom Road, it is recommended to include the installation of the new bike lanes proposed and shown in *Figure 2 – University Avenue Parking Study*. The elimination of parking block 2 is expected to cause drivers to utilize the off-street parking options or parking block 1, which never reached practical capacity throughout the period of this parking study.

East Avenue

Due to the observed public's underutilization of on-street parking and the availability of off-street parking lots and driveways that can be used for parking multiple vehicles along East Avenue between Culver Road and Probert Street it is recommended to include the installation of new bike lanes proposed and shown in *Figure 3 – East Avenue Parking Study*.

Culver Road (from Garson Avenue to Laurelton Road)

Due to the observed public's underutilization of on-street parking blocks 4 – 7, 16, and 17, as well as the availability of off-street parking lots and driveways that can be used for parking multiple vehicles along Culver Road between Garson Avenue and Laurelton Road, it is recommended to include the installation of new bike lanes proposed and shown in *Figure 4 – Culver Road Parking Study*.

Culver Road (from Clifford Avenue to Norton Street)

Due to the observed public's underutilization of on-street parking and the availability of off-street parking lots and driveways that can be used for parking multiple vehicles along Culver Road between Clifford Avenue and Norton Street it is recommended to include the installation of new bike lanes proposed and shown in *Figure 5 – Culver Road Parking Study*.
