EXECUTIVE SUMMARY

Background and Objective

LaBella was retained by the City of Rochester to conduct a Phase II ESA of the property located at 42 York Street, in the City of Rochester, Monroe County, New York (“Site”). The Site is comprised of one approximate 0.48-acre parcel located within the Bull’s Head redevelopment area and is currently an unused paved parking lot located in an urban setting. This Phase II ESA is part of the USEPA Brownfields Multipurpose Grant Program awarded to the City of Rochester in 2021.

An environmental investigation was previously completed for the Site and surrounding properties (by others) in 2018. The previous investigation identified the presence of SVOCs and metals in soil/fill material on the Site, including select areas where heavy metals and SVOCs were present at concentrations exceeding NYSDEC Restricted Residential Use SCOs. The purpose of this Phase II ESA was to further define the nature and extent of contamination identified by the previous investigation. The primary scope of this Phase II ESA included the excavation of test pits, collection of soil samples, installation of a groundwater monitoring well, and collection of groundwater samples.

Scope

Ten (10) test pits were advanced at the Site and one (1) groundwater monitoring well was installed. Six (6) soil samples for further investigation/delineation of contaminants were collected and analyzed for VOCs, SVOCs, and metals concentrations. Six (6) soil samples for waste characterization purposes were analyzed for TCLP VOCs, TCLP SVOCs, TCLP Metals, PCBs, Reactivity, Corrosivity, and Ignitability. Two (2) groundwater samples (one from the newly installed monitoring well and one from an existing monitoring well) were analyzed for VOCs, SVOCs, and metals concentrations. Activities were conducted in accordance with the USEPA-approved QAPP (including collection of QA/QC samples).

Findings / Conclusions

Shallow soil at the Site consists of a layer of material typical of urban soil and fill. The fill layer is generally present across the Site, with varying thickness. The fill is generally thickest (approximately seven (7) feet) on the southern portion of the Site and thinner (approximately two (2) feet) on the northern portion of the Site. The fill contains one or more of the following constituents at each location investigated during this assessment:

- Ash;
- cinders;
- slag;
- brick;
- wood;
- metal;
- glass; and/or,
- stone/concrete fragments.

The finding of urban soil/fill containing ash and cinders is consistent with historic investigation of the Site and surrounding area performed in 2018 (by others).

Lead was detected in exceedance of applicable SCG in one (1) soil/fill sample collected during this assessment, expanding the footprint of previously identified extents where soil/fill in exceedance of applicable SCG is present on the Site. Various other metals (including cadmium, copper, mercury, nickel, and zinc) were detected in exceedance of Unrestricted Use SCOs in one or more samples of the urban soil/fill collected from the Site during this investigation.

Groundwater is present at an approximate depth of five to six (5-6) feet below existing ground surface at the Site. Groundwater is estimated to flow to the northwest across the Site, based on areal data collected during this investigation.

Although not detected in exceedance of applicable SCG, TCE was detected in groundwater at one sample location on the Site.

Apparent bedrock is generally present at an approximate depth of 7 to 9.5 feet below existing ground surface at the Site.

Fill/soil exceeding the standards for hazardous waste via TCLP analysis (waste characterization sampling) has not been identified at the Site.

Recommendation

Urban soil/fill material present at the Site includes (but is not limited to) ash and cinders. These fill materials are considered a solid waste by the NYSDEC that cannot be treated as construction and demolition (C&D) solid waste, due to the nature of its origin as a solid waste derived from an industrial source. In accordance with 6 NYCRR Part 360.13(c), fill materials containing ash and cinders may be managed and placed into similar filled areas within the same site under appropriate cover. Alternatively, these materials can be disposed off-site in a New York State Part 360 permitted landfill. Based on the proposed future development of the Site, the presence of benzo(a)pyrene, arsenic, and lead in exceedance of applicable SCGs (Restricted Residential Use and Commercial Use SCOs) in the urban soil/fill layer in discrete areas, and additional metals in exceedance of Unrestricted Use SCOs in additional areas, it is recommended that any such urban soil/fill be appropriately handled, transported, and disposed at a NYS Part 360 permitted landfill, rather than re-used on-site, as the presence of this fill material places a hindrance on the redevelopment of the property from both an environmental and geotechnical consideration.

In summary, remedial efforts targeting the removal of fill material and the associated SVOCs and metals impacts are recommended in order to provide a clean site that promotes redevelopment.

1.0 INTRODUCTION

LaBella Associates, D.P.C. (“LaBella”) was retained by the City of Rochester to conduct a Phase II Environmental Site Assessment (ESA) of the property located at 42 York Street, in the City of Rochester, Monroe County, New York, hereinafter referred to as the “Site” (see Figures 1 and 2). This Phase II ESA is part of the USEPA Brownfields Multipurpose Grant Program awarded to the City of Rochester in 2021.

The scope and conditions of this ESA were in accordance with Task 3 of LaBella’s Proposal dated August 3, 2022, and the Quality Assurance Project Plan (QAPP) prepared for the assessment (Revision Number 3, dated June 19, 2023).

1.1 Limitations & Exceptions

Work associated with this Assessment was performed in accordance with generally accepted environmental engineering and environmental contracting practices for this region. LaBella Associates, D.P.C., makes no other warranty or representation, either expressed or implied, nor is one intended to be included as part of its services, proposals, contracts, or reports.

In addition, LaBella cannot provide guarantees, certifications, or warranties that the property is or is not free of environmental impairment or other regulated solid wastes. The Client shall be aware that the data and representative samples from any given soil or groundwater sampling point may represent conditions that apply only at that particular location, and such conditions may not necessarily apply to the general Site as a whole and may change with time.

2.0 BACKGROUND

2.1 Site Location and Description

The Site is comprised of one approximate 0.48-acre parcel (SBL #120.42-2-72.001) located at 42 York Street, in the City of Rochester, Monroe County, New York. Refer to Figure 1 for the approximate Site location (map) and Figure 2 for a local site plan. The Site is within the Bull’s Head redevelopment area and is currently an unused paved parking lot. The Site is located in an urban setting.

2.2 Adjacent Property Use

The Site is presently bordered by the following properties:

Direction	Address	Current Land Use
North	50 York Street	Vacant Lot / Undeveloped
East	866 West Main Street	Vacant Lot / Gravel Parking
South	(Beyond Ruby Place ROW) Multiple (888-910 West Main Street)	Vacant Lot / Undeveloped
West	Multiple (24-32 York Street)	Vacant Lot / Undeveloped
	(Beyond York St ROW) Multiple (21-55 York Street)	Single Family Residential

2.3 Site History & Land Use

The Site appeared to be first developed with several residential dwellings and sheds/barns on portions of the parcel from 1892 to at least 1935.

On aerial photographs dated 1988, 1993, and 2003, approximately 15 vehicles are parked on the Site. In addition, apparent dark staining and miscellaneous items (which may be indicative of debris) appear to be located throughout the Site. The staining and debris on the Site may also be indicative of current or former industrial/manufacturing use of the property or affects from surrounding properties. Potential concerns associated with an industrial/manufacturing use of a property include the contamination of soil and/or groundwater if leaks/spills and/or improper handling/disposal of hazardous materials, petroleum products, and/or hazardous wastes has occurred.

2.4 Summary of Previous Studies

A previous environmental investigation was completed for the Site and surrounding properties by Day Environmental in 2018. The previous investigation identified the presence of semi-volatile organic compounds (SVOCs) and metals in soil/fill material on the Site. The prior investigation identified select areas where heavy metals and SVOCs were present at concentrations above Restricted Residential Use Soil Cleanup Objectives (SCOs). More specifically, these impacts were identified in samples collected from test pits TP-13 (sample depth 1-2-ft bgs) and TP-14 (sample depth 3.5-ft bgs), both located on the subject Site (42 York Street).

Further reference to the environmental investigation performed in 2018 is provided throughout this report and the included Figures. On Figures 2 and 5, the 2018 investigation locations are identified as “Historic Soil Boring” and “Historic Test Pit Location.”

3.0 OBJECTIVE

The purpose of this Phase II ESA was to further define the nature and extent of contamination identified by previous investigation of the Site, which identified the presence SVOCs and metals in fill material on the Site.

In addition to field screening and observation, up to six (6) soil samples for laboratory analysis of the following parameters was scoped. These six (6) soil samples were for further investigation and delineation purposes.

- Target Compound List (TCL) and NYSDEC Commissioner Policy (CP)-51 list Volatile Organic Compounds (VOCs) using USEPA Method 8260D;
- TCL and NYSDEC CP-51 list Semi-volatile Organic Compounds (SVOCs) using USEPA method 8270E; and,
- Target Analyte List (TAL) Metals using USEPA 6010D/7471B.

In addition to the six (6) investigation (aka delineation) samples (above), four (4) soil samples for waste characterization purposes were scoped for the following parameters:

- Toxicity Characteristics Leachate Procedure (TCLP) VOCs using USEPA Method 8260D/1311;
- TCLP SVOCs using USEPA Method 8270E/1311;
- TCLP Metals using USEPA Method 6010D/7471B/1311;
- Polychlorinated Biphenyls (PCBs) using USEPA Method 8082A;
- Reactivity using USEPA Methods 9010C and Ch. 7 of SW-846;
- Ignitability using USEPA Method 1030; and,
- Corrosivity (pH) using USEPA Method 9045D.

Finally, to assess groundwater conditions on the Site, two (2) groundwater samples for laboratory analysis of the following parameters was scoped:

- TCL and CP-51 list VOCs using USEPA Method 8260D;
- TCL and CP-51 list SVOCs using USEPA method 8270E; and,
- TAL Metals using USEPA method 6020B/7470A.

4.0 FIELD INVESTIGATION - METHODOLOGY

Field activities associated with this ESA occurred in July-August 2023.

4.1 Public Utility Stakeout and Private Mark-Out

Prior to the initiation of subsurface work, an underground utility stake-out, via *UDig NY*, was completed at the Site to locate public utilities at the perimeter of the Site and along easements.

To supplement the public utility stake-out and further verify that proposed test pit locations would not disrupt subsurface utilities, a private utility mark-out for the investigation areas was completed by On The Mark Utility Locating Services, Inc. on July 5, 2023.

4.2 Test Pitting Study and Soil Sample Analysis

LaBella personnel oversaw the advancement of ten (10) test pits (TP-01 through TP-10) at the Site on July 11-12, 2023. Test pit locations were determined by the results of the public and private utility stakeout, historical records, and limited to approved/accessible areas of the Site. Test pits were excavated to depths ranging from approximately 4.5 to 9.75 feet (ft) below ground surface (bgs). Test pit locations are depicted on Figure 3.

Test pits were advanced by LaBella ENV, LLC, using a Kubota KX080-4 excavator. Soil samples were collected from various depths in each test pit and were visually and physically examined by LaBella personnel. Observations were made of the general lithology, visible layering, evidence of non-native fill/historic fill materials, indications of chemical or other staining, odors, and other distinctive features. Portions of the soil from borings were field screened for the presence of VOCs using a PID equipped with a 10.6 electronvolt (eV) lamp. Positive indications from any of these screening methods are collectively referred to as “evidence of impairment”. PID data and observations from each test pit are included on the test pit logs presented in Appendix 2.

Samples were selected from the test pits for laboratory analysis based on field evidence for the presence of fill materials, field screening, and PID readings to address the environmental concerns identified at the Site. A summary of the soil samples submitted for laboratory analysis are summarized in Section 4.6 (Laboratory Analytical Program).

Upon completion of test pit activities, the excavated materials were returned to the test pits from which they originated from on a first-out, last-in basis. The excavator bucket and tracks were used to compact the backfilled material. No additional compaction / testing was performed. Asphalt present at the surface was segregated from soils and placed back on top of each test pit following backfill.

4.3 Groundwater Monitoring Well Installation & Sampling

4.3.1 Groundwater Monitoring Well Installation

LaBella personnel oversaw the installation of one (1) overburden / bedrock interface groundwater monitoring well (YS-MW-2023-01) on July 17, 2023. The groundwater monitoring well location was determined by the results of the public and private utility stakeout, historical records, and limited to

the accessible area of the Site. The groundwater monitoring well was advanced to a terminal depth of 11.0 ft bgs. The groundwater monitoring well location is depicted on Figure 3.

The groundwater monitoring well was installed by LaBella ENV, LLC, using a Geoprobe Model 7822DT rig. Hollow stem augers having a 4.25-inch interior diameter and an 8-inch exterior diameter, were advanced into the upper 2-feet of bedrock, which was identified at an approximate depth of 7-feet 10-inches bgs. LaBella personnel logged and screened the soil using a PID during well installation. The monitoring well was constructed with 8-ft of 0.010-slot well screen of 2-inch inner diameter Schedule 40 polyvinyl chloride (PVC) screen attached to solid riser piping of the same material to complete the well. The well was installed as an overburden/bedrock interface well that was intended to intersect the top of the overburden groundwater table. The annulus was sand packed with quartz sand to a nominal depth of 1-ft above the screen section and a 0.8-ft bentonite seal was placed above the sand pack. Monitoring well YS-MW-2023-01 was completed with a flush mount well cover grouted into place. The groundwater monitoring well construction log is presented in Appendix 2.

4.3.2 Groundwater Monitoring Well Development

Lu Engineers developed the newly installed groundwater monitoring well (YS-MW-2023-01) on July 19, 2023 (approximately 48 hours after installation). Development occurred by the use of a submersible pump until the well was dry (after approximately 5 gallons (equal to approximately 6.4 well volumes) was removed from the well).

Turbidity noticeably improved during the well development process, based on visual observation.

The groundwater well development log is presented in Appendix 2.

4.3.3 Groundwater Sampling

Lu Engineers collected groundwater samples from monitoring wells YS-MW-2023-01 and MW-01 on July 26, 2023 (one (1) week after development of YS-MW-2023-01). Groundwater samples were collected using low-flow methodologies (bladder pump).

Groundwater purge/flow rates were minimized in an effort to limit drawdown of groundwater in the wells (i.e., to ensure the water table remained within proximity to the initial static water level depth). During purging activities, groundwater passed through a flow through cell equipped with a YSI Pro DDS water quality meter that measured certain groundwater quality parameters. After passing through the cell, the groundwater was discharged and temporarily contained in 5-gallon buckets (before ultimate placement in a 55-gallon drum, labeled, and left on-site pending proper disposal). The following water quality parameters were measured and recorded at five (5) minute intervals during the groundwater purge and sampling process. Groundwater samples for laboratory analysis were collected once the parameters stabilized according to the provided allowances:

- Temperature (+/- 3%)
- pH (+/- 0.1 unit)
- Dissolved oxygen (+/- 10%)
- Specific conductance (+/- 3%)
- Oxidation reduction potential (+/- 10 millivolts)
- Turbidity (+/- 10% or <50 NTU for metals is possible)

Groundwater samples submitted for laboratory analysis are summarized in Section 4.6 (Laboratory Analytical Program). Groundwater sampling logs are included in Appendix 2.

4.4 Investigation Location and Elevation Survey

Costich Engineering, D.P.C., a professional land surveyor (PLS), collected investigation location and elevation information on August 3, 2023, under the supervision and direction of LaBella personnel.

The survey included collection of data from beyond the limits of the Site, where historic investigation has occurred (i.e., historic/existing groundwater monitoring wells in the vicinity of the Site) in support of preparing an areal groundwater elevation contour map.

The information collected during the survey has been used throughout this report, including all Figures herein. The complete survey has been included as Appendix 1.

4.5 Community Air Monitoring Program

Air monitoring was completed in accordance with the NYSDOH Generic Community Air Monitoring Plan (CAMP) during intrusive subsurface activities. The CAMP includes the use of PIDs and particulate monitoring equipment (i.e., 'DustTrak') to document VOCs and airborne dust/particulate in real-time. Data from upwind (background) and downwind of the work area is compared over fifteen (15) minute intervals.

Air monitoring instruments were calibrated and maintained in accordance with the manufacturer's specifications.

No exceedances of applicable air quality standards were observed during field investigation activities where active air monitoring (CAMP implementation) occurred.

Refer to Appendix 4 for CAMP data and equipment calibration certificates.

4.6 Laboratory Analytical Program

Soil and groundwater samples collected for laboratory analysis were placed directly into laboratory-supplied containers, preserved as appropriate in a cooler, and submitted under standard chain-of-custody protocol to the local office of Alpha Analytical (in Rochester, NY) for courier service to Alpha Analytical's laboratory in Westborough, Massachusetts. Alpha Analytical is a New York State Department of Health (NYSDOH) Environmental Laboratory Approval Program (ELAP) certified laboratory.

The following samples were submitted for laboratory analysis:

4.7 Investigation Derived Waste

Two (2) fifty-five (55) gallon steel drums of investigation derived waste (IDW) were generated during this investigation:

- One (1) drum of excess soil cuttings generated by the installation of groundwater monitoring well YS-MW-2023-01; and,
- One (1) drum of groundwater generated by the development of groundwater monitoring well YS-MW-2023-01 and the pre-sampling purging of groundwater monitoring wells YS-MW-2023-01 and MW-01 (historic well).

Both drums are only partially filled and have been appropriately labeled and staged on-site. Additional groundwater generated by potential future sampling/monitoring events may be added to the

groundwater drum. Each drum is pending appropriate future disposal.

4.8 Deviations to Objective

Based on field observations and a re-evaluation of the estimated quantity of fill material present on the Site, two (2) additional waste characterization samples (for a total of six (6) waste characterization samples) were collected during this assessment. The additional samples are necessary for obtaining approval to dispose of the additional material expected to require off-site transport/disposal, based on fill layer thickness observations made during the field investigation.

5.0 FINDINGS

5.1 Utility Locating

LaBella notified *UDig NY* of the pending subsurface investigation planned for the Site so that public buried utilities would be field-marked prior to initiating any excavation/test pits or groundwater monitoring well installation activities. Via the *UDig NY* stakeout process, no public utilities were identified in an area of concern relative to the proposed investigation.

On July 5, 2023, a private utility locator (On The Mark Locating) used GPR and electro-magnetic sensing equipment to clear an approximately fifteen (15) foot radius around each investigation area to re-confirm that no buried utilities or other subsurface anomalies were present.

No buried utilities or other subsurface anomalies were identified by the private utility locating process.

5.2 Test Pit Evaluation - Localized Geology and Hydrology

5.2.1 Geology (Soil)

Ten (10) test pits were advanced at the Site on July 12-13, 2023, designated TP-01 through TP-10.

Most of the Site is covered by an approximately 0.25-ft thick layer of broken asphalt. An approximately 0.5-ft thick layer of angular subbase gravel exists beneath the asphalt layer. Noticeable urban fill (including apparent ash, brick, various forms of metal, slag, glass, wood, and apparent dolostone building footer blocks) was observed below the asphalt and asphalt subbase (gravel) layers, with the exception of test pit TP-02 (where urban fill was not observed). Soil beneath the urban fill/ash layer consisted generally of light tan to brown fine sand, some silt, little sub-rounded gravel including limestone, red sandstones, dolostones, trace amounts of chert, trace plastic clay, and trace cobbles. Apparent bedrock was encountered at depths ranging from 4.5 to 9.75 ft bgs. No oxidation-transition zone was identified in any of the ten (10) test pits completed.

Below is a table summarizing the fill identified in each of the ten (10) test pits advanced during this investigation:

Location / Sample ID	Depth Range of Identified Fill (ft bgs)	Identified Fill Material Type
TP-01	1.5 - 3.0	Little brick
	3.0 - 5.0	Ash layer including glass and wood
TP-02	<i>No identified fill material</i>	
TP-03	0.5 - 2.0	Wood planks; brick; metal; apparent black cinders
	3.0 - 5.0	Ash fill layer including glass and wood

Location / Sample ID	Depth Range of Identified Fill (ft bgs)	Identified Fill Material Type
TP-04	0.5 - 2.0	Black stained fill material – apparent brick road with ash and terracotta subbase on the northeast end of test pit; apparent dolostone building foundation blocks on the west end of the test pit.
TP-05	0.5 - 2.5	Ash layer including brick, slag, wire, and glass
TP-06	1.4 - 3.0	Ash layer on the south end of test pit including metal; gaskets; brick; glass; apparent burnt rock
TP-07	2.0 - 4.5	Ash layer including glass; slag; metal; burnt wood
TP-08	1.0 - 1.25	Ash
	1.25 - 2.0	Slag; charcoal
	2.0 - 7.0	Fine sand intermixed with brick and metal
TP-09	0.75 - 2.0	Ash; glass; brick
TP-10	2.0 - 6.5	Brick; metal; glass; ash
	6.5 - 9.5	Possible dolostone footer wall blocks

Refer to Figure 6 for a depiction of fill locations and depths.

5.2.2 Hydrology (Groundwater)

Groundwater was encountered in test pits TP-06 and TP-07 at depths of approximately 6.0 and 5.4 ft bgs, respectively.

The limited number of groundwater monitoring wells on the Site limits the ability to infer groundwater flow direction solely based on Site data. In lieu of such, depth to groundwater data collected from existent groundwater monitoring wells in the vicinity of the Site (on adjacent and nearby City-owned parcels) was used to generate an areal groundwater contour map. Figure 4 displays approximate groundwater elevation contours and flow direction using surveyed elevations and depth to groundwater measurements collected on August 3, 2023. Based on the measurements and Figure 4, groundwater appears to flow to the northwest in the vicinity of the Site, generally consistent with the assumed regional flow toward Lake Ontario, north of the Site.

5.3 Field Screening Results

The table below summarizes PID readings obtained at various depth intervals from the Phase II investigation. As shown in the table, no detectable PID response was observed during the investigation.

Summary of PID Readings

Notes:

1. All PID readings were collected utilizing a Minirae 3000 photoionization detector and are expressed in parts per million.
2. The PID screening is performed as a method of determining general presence of VOCs in soil, and to provide a basis for selecting samples for laboratory analysis. The readings obtained provide only an indication of the relative levels of VOC presence in the soil and is not considered to be a direct quantization of actual soil VOC concentration.
3. "--" denotes boring not completed to above-listed depth or insufficient recovery occurred at specified depth.
4. "*" denotes a soil sample was submitted for laboratory analysis from this interval.

5.4 Laboratory Analytical Results

The purpose/objective of the Phase II ESA is to evaluate the nature and extent of contamination at the Site to determine the remediation necessary to redevelop the Site. The Site is located in a mixed residential/commercial area; therefore, the data generated during the course of the project is compared to the following NYSDEC Standards, Criteria and Guidance (SCGs) most appropriate for such proposed redevelopment.

Soil

- NYSDEC Part 375 Restricted Residential Use Soil Cleanup Objectives (SCOs) (12/14/2006)
- NYSDEC Part 375 Commercial Use SCOs (12/14/2006)
- NYSDEC CP-51 Soil Cleanup Levels (10/21/2010)
- Maximum Concentration of Contaminants for Toxicity Characteristic (RCRA Hazardous Waste "D-List" – CFR Part 261)

Groundwater

- NYSDEC Division of Water Technical and Operational Guidance Series (1.1.1), Ambient Water Quality Standards and Guidance Values and Groundwater Effluent Limitations (6/1998 and subsequent updates).

5.4.1 Soil Sample Results

VOCs:

Soil samples from six (6) locations were analyzed for VOCs. VOCs were not detected in any of the samples. As such, no exceedances of applicable VOC SCGs were identified.

SVOCs:

Soil samples from six (6) locations were analyzed for SVOCs. SVOCs were detected in two (2) of the samples. However, no exceedances of applicable SVOC SCGs were identified.

Metals:

Soil samples from six (6) locations were analyzed for metals. Metals were detected in each of the samples (Note: many metals are naturally occurring in the environment and are routinely detected at 'background' concentrations in soil. Only when metals concentrations exceed Unrestricted Use SCOs are they of potential concern).

At least one metal was detected at a concentration exceeding its Unrestricted Use SCO in five (5) of

the samples. Exceedances of Unrestricted Use SCO for metals included at least one of the following:

- cadmium;
- copper;
- lead;
- mercury;
- nickel; and/or,
- zinc.

Lead was detected at a concentration exceeding its Restricted Residential Use SCO and Commercial Use SCO in one (1) sample/location (TP-04).

For a complete summary of analyzed and detected compounds in soil, refer to Tables 3A, 3B, and 3C. Refer also to Figure 5 (Summary of Soil Conditions).

5.4.2 Groundwater Sample Results

VOCs:

Groundwater samples from two (2) locations were analyzed for VOCs.

The VOCs trichloroethene (TCE) and acetone were detected at one location; however, the detected concentrations do not exceed their applicable SCGs.

No other VOCs were detected in the groundwater samples collected.

SVOCs:

Groundwater samples from two (2) locations were analyzed for SVOCs.

The SVOC pentachlorophenol (PCP) was detected at both locations; however, the detected concentrations do not exceed the applicable SCG.

Trace concentrations of various polyaromatic hydrocarbons (PAHs – a subset of SVOCs) were detected at one location. However, the detected concentrations were below the laboratory method reporting limit and are therefore qualified as estimates, and the results were not reproduced in the field duplicate collected from the same location.

Metals:

Groundwater samples from two (2) locations were analyzed for metals.

Metals were detected in each of the samples (*Note: many metals are naturally occurring in the environment and are routinely detected at 'background' concentrations in soil and groundwater. Only when metals concentrations exceed SCGs are they of potential concern*).

Iron was detected at a concentration exceeding its SCG in both locations. The detected concentration was not reproduced in the field duplicate collected from the same location (one field duplicate).

For a complete summary of analyzed and detected compounds in groundwater, refer to Tables 4A, 4B, and 4C.

5.4.3 Waste Characterization Sample Results

Six (6) soil samples were collected and analyzed for waste characterization purposes, including via Toxicity Characteristic Leachate Procedure (TCLP) procedures, for total polychlorinated biphenyls

(PCBs), and hazardous waste characteristics (reactivity, ignitability, and corrosivity).

TCLP VOCs:

No targeted VOCs were detected by TCLP analysis of the soil/fill.

TCLP SVOCs:

No targeted SVOCs were detected by TCLP analysis of the soil/fill.

TCLP Metals:

Trace concentrations of barium, cadmium, and lead were detected by TCLP analysis of the soil/fill; however, the detected concentrations do not exceed the applicable TCLP standard.

Reactivity:

Reactive cyanide and sulfide were not detected within the soil/fill.

Corrosivity:

The soil/fill is relatively neutral (non-corrosive), with a pH ranging from 7.07 to 8.32.

Ignitability:

The soil/fill is not ignitable (i.e., flash point greater than 140° F).

5.4.4 Quality Assurance / Quality Control

Soil QA/QC Samples

One Matrix Spike/Matrix Spike Duplicate (MS/MSD) for VOCs, SVOCs, and metals in soil was collected.

One blind field duplicate for VOCs, SVOCs, and metals in soil was collected. The blind field duplicate results are reported alongside their respective parent sample in the attached Summary Tables. There was general agreement between the duplicate and parent sample results for all parameters.

Groundwater QA/QC Samples

One MS/MSD for VOCs, SVOCs, and metals in groundwater was collected.

One blind field duplicate for VOCs, SVOCs, and metals in groundwater was collected. The blind field duplicate results are reported alongside their respective parent sample in the attached Summary Tables. There was general agreement between the duplicate and parent sample results for VOCs. Trace concentrations of SVOCs in the parent sample were not reproduced in the duplicate sample for SVOCs. For metals analysis, the SCG exceedance of iron identified in the parent sample was not reproduced in the duplicate sample.

It is possible that turbidity varied between the parent and duplicate groundwater samples (i.e., that the parent sample was more turbid than the duplicate sample), which can result in differing results for SVOCs and metals. A more turbid sample may contain concentrations of SVOCs and metals as a result of the presence of suspended sediment.

A Trip Blank accompanied the groundwater samples collected for VOCs analysis. No VOCs were detected in the Trip Blank sample, indicating no concerns with cross-contamination of the groundwater samples by VOCs during sample collection/handling and transport.

Data Usability Summary Report

Data Usability Summary Reports (DUSR) and third-party data validation was provided by Laboratory Data Consultants, Inc. A separate DUSR was prepared for the soil and groundwater data obtained during this assessment, since the samples were collected on different days and submitted under

separate chain of custody (i.e., separate laboratory reports).

As stated in the DUSR, all results are usable as reported or usable with minor qualification due to laboratory quality control outliers and/or sample matrix. The complete DUSR are included in Appendix 6 for reference.

Qualifiers added by the data validation process have been included in the Summary Tables, where applicable.

6.0 CONCLUSIONS

Based on the findings of this Phase II ESA, the following conclusions have been drawn:

- Shallow soil at the Site consists of a layer of material typical of urban soil and fill. The fill layer is generally present across the Site, with varying thickness. The fill is generally thickest (approximately seven (7) feet) on the southern portion of the Site and thinner (approximately two (2) feet) on the northern portion of the Site. The fill contains one or more of the following constituents at each location investigated during this assessment:
 - Ash;
 - cinders;
 - slag;
 - brick;
 - wood;
 - metal;
 - glass; and/or,
 - stone/concrete fragments.

Urban fill materials (including those containing ash and cinders) are considered a solid waste by the NYSDEC (see Section 7.0 – Recommendations, for further information).

The finding of urban soil/fill containing ash and cinders is consistent with historic investigation of the Site and surrounding area performed in 2018 (by others).

- Lead was detected in exceedance of applicable SCG in the soil/fill sample collected from TP-04 (0.5-2.5 ft bgs) (material unsuitable to remain where Restricted Residential or Commercial Use is planned). This finding expands the footprint of previously identified extents where soil/fill in exceedance of applicable SCG is present on the Site (i.e., TP-13 1-2 ft bgs and TP-14 3.5 ft bgs).
- Various other metals (including cadmium, copper, mercury, nickel, and zinc) were detected in exceedance of Unrestricted Use SCOs in one or more samples of the urban soil/fill collected from the Site during this investigation.
- Groundwater is present at an approximate depth of five to six (5-6) feet below existing ground surface at the Site. Groundwater is estimated to flow to the northwest across the Site, based on areal data collected during this investigation.
- Iron was detected in exceedance of applicable SCG in the two (2) groundwater samples collected from the Site.
- Although not detected in exceedance of applicable SCG, TCE was detected in groundwater at one sample location on the Site.

- Apparent bedrock is generally present at an approximate depth of 7 to 9.5 feet below existing ground surface at the Site.
- Fill/soil exceeding the standards for hazardous waste via TCLP analysis has not been identified at the Site, based on field observations and analytical data.

7.0 RECOMMENDATION

Urban soil/fill material present at the Site includes (but is not limited to) ash and cinders. These fill materials are considered a solid waste by the NYSDEC that cannot be treated as construction and demolition (C&D) solid waste, due to the nature of its origin as a solid waste derived from an industrial source. In accordance with 6 NYCRR Part 360.13(c), fill materials containing ash and cinders may be managed and placed into similar filled areas within the same site under appropriate cover. Alternatively, these materials can be disposed off-site in a New York State Part 360 permitted landfill. Based on the proposed future development of the Site, the presence of benzo(a)pyrene, arsenic, and lead in exceedance of applicable SCGs (Restricted Residential Use and Commercial Use SCOs) in the urban soil/fill layer in discrete areas, and additional metals in exceedance of Unrestricted Use SCOs in additional areas, it is recommended that any such urban soil/fill be appropriately handled, transported, and disposed at a NYS Part 360 permitted landfill, rather than re-used on-site, as the presence of this fill material places a hindrance on the redevelopment of the property from both an environmental and geotechnical consideration. In summary, remedial efforts targeting the removal of fill material and the associated SVOCs and metals impacts are recommended in order to provide a clean site that promotes redevelopment.

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. All specific QC information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications. Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances the specific failure is not narrated but noted in the associated QC table. The information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications.

Please see the associated ADEx data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

Case Narrative (continued)

Report Submission

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

Semivolatile Organics

L2339907-06 and -07: The sample has elevated detection limits due to the limited sample volume utilized during extraction, as required by the sample matrix.

Total Metals

L2339907-02 through -07 and -09: The sample has elevated detection limits for all elements, with the exception of mercury, due to the dilution required by the sample matrix.

The WG1802988-3/-4 MS/MSD recoveries for aluminum (MSD 432%), iron (0%/1040%), and manganese (12%/290%), performed on L2339907-02, do not apply because the sample concentrations are greater than four times the spike amounts added. The MS/MSD RPD for manganese (29%) is above the acceptance criteria. The WG1802988-3/-4 MS/MSD recoveries, performed on L2339907-02, are outside the acceptance criteria for antimony (72%/66%), lead (MS 72%), magnesium (MSD 136%), and zinc (MS 60%). A post digestion spike was performed and was within acceptance criteria.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete.
